>
> Jason Heideloff
> heidelj@alleg.edu

I have no idea how much the chips cost but surely the 040 costs much more than the 030. Especially as it's "new".
I thought one of the amazing things about the Falcon was the low price.
Maybe this is one way they are doing it.
(I agree it would be nice to have a 040 ;->)

Just an opinion....

Very strange! I cannot see any logical reason why different language versions
could be responsible for this bug. I am going to ask the guys from BELA at
Atari fair next week about it.

Still wondering,
Markus.

But that is another good point to bring up. Why does Atari always seem to try and produce things so that they are cheaply priced? I think that people are turned off by lowly priced computers, especially from Atari anyway. I don't think the Power Without The Price motto can survive much longer.

1564. RAM expansion on the Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-08-14 13:13:57 UTC
From: hrs@aber.ac.uk
Message-ID: <1992Aug14.131357.13446@aber.ac.uk>
Source record: 218730

It was very interesting to read Sam T's interview on DELPHI about the new Falcon. I have a remark however regarding RAM expansion. He said that expanding the RAM on the Falcon will be via an 'Atari RAM board'. This sounds very similar (at least in concept) to RAM expansion on the TT. The Atari TT RAM expansion board has two problems as I far as I can make out, 1) it's *very* expensive, 2) it's also very difficult to get hold of. Instead most people I believe (including myself) opt for the German 3rd party board. This too has it's problems though, it's expensive (not as expensive as the Atari one), about 200 pounds (no ram chips) and it doesn't always necessarily work dependening on the TT motherboard, for example, I can never have the TT cache on because of timing problems (bombs out - yes they are suppose to be replacing the board but I've been waining almost 3 months already).

The SIMM slots on the STE are an ideal solution, RAM is easy to install and cheap, just look at the number of adverts for STE upgrades in British mags to realise how successful there are. Now why didn't they do the same for the Falcon!? I hope RAM upgrades on the Falcon won't be expensive as it is for the TT.

Otherwise I think the Falcon sounds like a great machine. I'd be interested to hear if anyone knows how it rates speed wise against the TT.

1565. Re: My MIDI ports dont work anymore :(

Newsgroup: comp.sys.atari.st
Date: 1992-08-14 13:41:46 UTC
From: azog@world.std.com
Message-ID: <Bsz7Do.MJw@world.std.com>
Source record: 218733

In article <BsxD91.F6G@world.std.com>, I write:

>Is there anything I can check to see if its really the ports, or perhaps
>my keyboard that got messed up? When I play a sequence thru my sequencer,
>it looks like its working, but no music. On my Kawai keyboard, usually
>when I press a key, on the LCD display, it shows a block cursor to visually
>acknowledge that MIDI data is being sent or recived.

I found a program called CKMIDI, that checks the MIDI ports, and came
to the conclusion:
The MIDI in works
The MIDI out doesnt....

The problem now is to see if the problem exists on the STe, or
if I damaged the keyboard. Since I dont have any other MIDI gear to
swap, I may bring my keyboard into the store where I purchased it and
have them check it...

>try and produce things so that they are cheaply priced?

Because people who buy expensive machines wouldn't buy from Atari. When you're contemplating multiples of $1,000 per box, things like service and a demonstrated history of success count for a lot. Atari has neither, as far as I can tell. When you're contemplating $500 or so (i.e.: about the cost of a VCR, stereo component, etc), you're treading into "impulse buy" range for many people, where considerations like "But will the company still exist 3 years from now?" seldom go...

> I think that
>people are turned off by lowly priced computers, especially from Atari
>anyway.

People are turned off by poor value, or by unknowns with price tags. A computer for which software is virtually nonexistent where most people shop (relatively few people are aware of Atari-specific mags and the mail-order houses which advertise in them) is a poor value for those people. A product line which Atari either refuses or is financially unable to advertise consistently is an unknown.

Face it, Atari has painted itself into a low-price niche. Not that there's anything wrong with that, if they can make money and decent products by being there. But I just can't fathom why people throw stones at them for not trying to make the hottest boxes on the street. If you have the money to buy something hotter, go buy it. Else, stop wishing for head-spinning

performance at bargain-basement prices; if no one else can do it, why expect
Atari can? Don't you think they would if they could??

> I don't think the Power Without The Price motto can survive much
>longer.

The what? Does Atari still use that line these days?

I'm sorry, I don't agree. If I want a more expensive machine - a more `serious' machine, if you like, then I will buy a PC - the industry standard home computer. However, what I want is a hobbyist machine whose operating system and users are constantly growing, developing and improving, whilst still delivering the power to run the applications I need; so I will opt for an Atari.

Myself, I am very impressed with the specs/price ratio so far. I do feel a little let down by the 16MHz clock speed. I will pay for 32MHz and fast memory in the Falcon. I'm sorry to say I will not be buying a 16MHz Falcon.

Yes, this is the only negative really about the rumours about the Falcon.
The recent reports all seem to point to 640x480 as the max at least for
the initial model. I sincerely hope that Atari plans on 800x600 or
1024x768 colour in a later model at well under $2000. Otherwise they
will release a brand new machine in 1992 that has lower res than
PC SuperVGA has had for some time. In 1992 640x480 just doesn't cut it.
The rest of the machine sounds wonderful though.

Oh c'mon, the answer is obviously price. The 68040 and high-speed memory would push the price way up. Don't forget the machine is not just a CPU-and-memory box, when you push clock rates up you usually have to boost the speed of all the custom chips, disk controllers, RAM controllers, video, etc etc. Atari are obviously trying to keep the price very low, an excellent idea IMHO. Also it is very likely there will be higher-end models with more horsepower. BTW, most of the Apple line use 030's.

1572. Re: Gemulator (now taking orders!)

Newsgroup: comp.sys.atari.st
Date: 1992-08-14 16:32:25 UTC
From: darekm@microsoft.com
Message-ID: <1992Aug14.163225.2234@microsoft.com>
Source record: 218745

In article <F5JFPB2w164w@tcpbbs.pcn.org> joeadato@tcpbbs.pcn.org (Joseph Adato) writes:
>I just got the demonstration video for Gemulator, the ST emulator for
>any IBM/IBM clone computer. I must say what I saw was very impressive.
>I strongly recomend that anyone slightly interested in the subject of
>have an ST emulator for the PC spend the $5.00 and get a copy.

Thanks for that positive remark about Gemulator. They're quite rare
here on the net. <grin> But interest in ST emulation is picking up.

I just thought I'd update you on what's been happening with it. First of
all, there is now a distributor for Gemulator, and they are already taking
orders. As I said many months ago, I would not be involved in the actual
distribution of Gemulator to avoid any problems I experienced with Quick ST,
mainly in the area of shipping product on time and supporting customers. PMC
in Bellevue, WA is the distributor and look for a press release from them
very shortly. If you already pre-ordered you'll be receiving a letter from them.

This weekend at the Atari show in Hartford, CT will be the last demo of
Gemulator prior to its release next month at the Glendale show. You will
be able to place orders at the show at the introductory price. The 1/2
price introductory offer has been changed slightly, in that TOS 2.06 ROMs
are now included and pre-installed on every Gemulator board. Of course, there
are still 6 empty sockets to plug in other TOS versions. The new intro price
for Gemulator + TOS 2.06 is $279, $20 less that before. Pre-installing TOS
ROMs will insure that a) you can just plug in and use Gemulator, b) you don't
have to muss with plugging in TOS ROMs, or finding TOS ROMs for that matter,
and c) it allowed me to make a very large purchase of TOS 2.06 ROMs and
lower the price!

Gemulator has also been reduced in size and sped up by between 10% and 40%
since last shown at the Indianapolis show last month. It can now run on
a 6 meg PC (instead of an 8 meg PC) directly, or on a 4 meg PC when you use
virtual memory. Virtual memory slows down the program somewhat, but there is
simply no way to cram DOS, device drivers, the Gemulator code, 256K of TOS
ROM code, and 2 meg of Atari ST memory into a 4 meg PC. You need 6 meg. And
yes, it will run on a 386SX all the way up to a 486/50. On a 486/33 it's
running slightly faster than a 8 Mhz ST, on a 486/50 it runs almost as fast
as a 16 Mhz ST, and on a 386/33 it runs at half the speed of an ST.

Current Notes and other U.S., U.K., and German magazines currently all have
Gemulator in their hands right now and are reviewing it. Look for the first
review of it in the September issue of Current Notes. (Of course, by then,
you will miss the introductory offer, but PMC is running a special of their
own until the end of September).

If you have any further questions about Gemulator, please call PMC at
206-747-1519. To place an order, order a newsletter, order a demo video, etc.
Don't call BraSoft because I will just have to refer you to them. :-)

They shipped them third class, so it could take up to four weeks to receive it. I got mine this past Monday.

If you don't receive it by the end of August, you might want to give them a call.

>

In the past, Atari's been accused of producing vaporware, i.e. announcing products and taking too long to deliver. This time, they're not announcing them until they're almost ready to ship.

>supposed to be even faster. My question is, why would any company, I

The Falcon is going to cost well under US$1000, have two hard drive interfaces (IDE and SCSI-II), 16Mhz 68030, 10+ MIPS DSP, LAN port, expandability to 14megs, Multitasking OS, processor direct slots, great graphics, and you're complaining because it's old technology?! What other computer has what the Falcon has for under $1000?

I just got my machine back from a relative that I lent it to for two
years. So, I'm trying to figure out whether to sell it or upgade it.
Its a 1040 ST with 1meg, ICD host adapter, mono monitor, and TOS 1.0.
I have read the faq's but still have some questions.

I am thinking about upgrading either the RAM or processor or both. What
would be a recomended solution?

What version of the OS to I need to go to?.

I have some software that I would like to know the latest (last?) version
Antic A-Calc Prime
Antic Flash
OSS Pascal
Megamax C
DBMan
Thunder
Easy Draw
Shankhai
Sundog
FS II
HabaWriter

Are there any dealers in the North Carolina Area?

Email replies are fine.

I'd like to add to this. 3) it is not very expandable (TTRAM) as it only goes to 16MB. The STRAM is not expandable at all (what a shame!)

> Instead most
>people I believe (including myself) opt for the German 3rd party board. This

>for the Falcon!? I hope RAM upgrades on the Falcon won't be expensive
>as it is for the TT.

I have to disagree, and for some of the reasons you mentioned. If Atari were to have implemented a SIMM slot sort of expansion for memory, it would 1)be expensive - to the cost of the machine, as well as to company-bought SIMMs. 2)It would not be that expandable. I mean, if the Atari board only handles 16MB, do you think that a cost-conscious Atari would make the internal SIMM handler go to more that that? Just think, if they had done that, there would not have been such a product as the German board that goes to _32MB_. You would have been stuck. The same thing goes for the Falcon - I hope they haven't made the BIOS so brain-dead that it will not allow memory to be used on the other side of the masked-out 2MBs -> you could have a memory map (similar to the TT) which has the 0-14MB RAM ->14-16MB BIOS/IO/ETC -> 16+RAM. Of course, it still stands to reason that this shouldn't prevent someone from making an accelerator similar to the ADSPEED or even the DX2 chips for INTEL. Both of these solutions require cache memory to be effective though...

>
>Otherwise I think the Falcon sounds like a great machine. I'd be interested
>to hear if anyone knows how it rates speed wise against the TT.

I think it sounds pretty good - in fact, it looks to be targeted as _the_ cheapest (near)professional music development platform yet.

I agree totally with this. However, the brief descriptions of the
PDS have made me feel a bit troubled. Whenever it is mentioned, the most
oft-heard description of it is that it will enable "386sx" boards to be
connected...and sometimes it is just "386" boards. So, does this mean that
the PDS only access 16-bits????? If it accesses 32bits, then why in the heck
will it be unable to use a 486? Lastly, if it can use a '486, then why do
people insist on remarking on its lowest capability, or maybe just refer
to it as being "IBM emulatable" and avoid the chip designations alltogether
(which will be a lot more important when PINK is more substantial).

Well, it seems that everybody has a rather low view of Atari today. So why did we all buy them? If you want a PC clone or a Mac or Unix box then get one and stop complainging! I got my TT last November for a number of reasons: (1)Unix machines are _way_ out of my price range (I did lust after a NeXT for a while, but reality eventually hit me in the face--and people shouldn't compare and Atari with a Next; they're a few thousand dollars different); (2) I still see PC's as suped-up 8 bit
machines (and have had little evidence otherwise); and (3) I could get an Atari with
a Mac emulator for less than a Mac or similar speed (and who really needs color on a Mac anyway--I've never had any use for it). So I've got my fast Mac, plus a free
Atari on the side (which, I've found, has more _useful_ PD software out there than anything short of a Unix). So are my reasons lagit?

And about the Falcon, I think that if Atari could actually manage to market these things right, it could be a big _cheap_ computer. Sure, maybe you could find a 386 in the same supposed price range, but with MIDI and DSP? My roommate forked out big money to put MIDI on his PC. As I see it, this is a musician's dream machine. I mean, what musician cares if his computer can beat a 386 in some meaningless benchmark? And the Falcon even has a TV output for those who don't care what their graphics look lik

e.

Anyway, the Falcon isn't even a competitor for the TT, and I think it's impossible to compare it to a NeXT. So if you like it, buy it; if not, then quit complaining.

>
>Jason Heideloff
>heidelj@alleg.edu
>

Let's put it this way. The reason I own an Atari computer is
because it did not cost very much to purchase.

Atari wants to give everyone as much as possible for say $700.00

If they included a 68040 and other stuff, they would have to charge
maybe $2000.00. Which do you think will sell better?

I think a powerful low-cost computer should do well. Even though
it may not be made up of the most recent technology.

And REMEMBER, this is Atari's low-end computer. I think it is a VERY GOOD
low-end computer. If Atari starts cheating on its high-end machines
then I will start complaining.

Len

I don't think people realize how fast a Motorola 16 MHz CPU is
compared to an Intel 20 Mhz CPU. It is pretty fast!

Also, the 32 MHz DSP should speed things up.

SPEED is different in different machines...

The author tried to make Atari look bad--plain and simple.

He brought up stuff like Sega investing millions of millions of
dollars to promote the Sega Masters system while Atari spent hardly
any to promote the 7800.

DID IT REALLY MAKE A DIFFERENCE? Sega wasted money by attempting
to fight Nintendo. The Sega Masters was a failure.

Of course, if Atari did spend that amount, they may have won the
law-suit against Nintendo.

We also didn't know EXACTLY what were the reasons behind things
such as Jack checking to make sure tips didn't exceed a certain amount.
Maybe people were writing down that they tipped $40 and really
pocketed the rest? If no one checked, this person could get away
with it.

I know there are problems at Atari but I think the author had
something against the company.

Hi,

I assume you tried a different cable? (I'm not trying to be "smart")

I'm not familiar with the "MIDI checker program", sounds useful.
Does it just require a cable looped from the ST's OUT->IN? Actually
if the out was broken, a perfectly good in could be suspected of
a problem...

When your MIDI device stopped working, was it while attaching
or detaching a cable with the power on? A friend of mine
blew the optoisolator in his MIDI bass that way...

Hope it's a cheap fix whatever it is,

John

>running slightly faster than a 8 Mhz ST, on a 486/50 it runs almost as fast
>as a 16 Mhz ST, and on a 386/33 it runs at half the speed of an ST.

486/33 only running at speed of 8 MHZ ST?!! Some people said it was
supposing to run 2-3 TIMES faster! WHAT happened?? People said
Gemulator demo running run from 100% RAMDISK too and it is fooling
everyone because real ST DMA is 2-3 TIMES faster than PC hard disk!!
What MIDI programs running now? Adlib is bankrupt and Soundblaster
has very very terrible MIDI port and sound. Turtle Beach board
for PC has DSP 56001 like in Atari Falcon but price is $800!!!!

Delphi report said Falcon is selling NEXT WEEK so Gemulator MUST
faster than 68030 16 MHZ, DSP 56001. Also PC needs 8 channel
16 bit stereo too! Falcon already using local bus and very
fast SCSI 2 so maybe 486/200 is needed???.

Someone will please post benchmarks of Gemulator and Falcon?

It is good to know good AND bad points about companies! Tramiel sons are like son of Wang Computer. Driving company without licence!! With Jack Tramiel back charge Atari Lynx is NUMBER ONE and Atari is putting GIANT 30 pages ads in magazines and many people in England are seeing Atari commercial in Battman Returns movie! With Lynx commercials on Star Trek show many more millions will be sold.

Other person in Amiga group said Atari and C= should join together and be best companies in the world! (Irving and Tramiel sons on bottom and Jack Tramiel back on top)

This could be unfortunate. There were occasions when Atari users
in Canada had better access to supplies of machines than did
our American friends. My experience with the US office is
that they do not answer mail.

Don't feel so bad. Look at what ST Report did: they published the rumors off of the TAF BBS saying that the place would be closed by Aug 5th, AND an apology from Ron Luks of CompuServe saying that Atari Canada was NOT closed.

Apparently this contradiction didn't require clarification in the eyes of the publisher of ST Report. And *you* feel stupid? His issue came out AFTER August 5th, he could have easily verified Atari Canada was in business by either calling them or faxing them. Instead all he did is spread contradictory rumors.

Typical.

regards,

Bob Brodie
Atari Corp.

True, but a 16 Mhz Falcon '030 is nowhere near as fast as a 32 Mhz Falcon '030!

>Also, the 32 MHz DSP should speed things up.

Only in applications written to utilize it. It's not like a Blitter!

[stuff about bitching about the Falcon deleted]
>I agree with Ken, anyway what's wrong with a 68030, what applications
>Jason do you have that really requires a 68040?

This is IMHO, flames and comments are welcome, as long as they are
logical...

It seems to me that the people who are now complaing about the Falcon
are probably weenies who want a NeXT-type of machine for $700. Face it,
the Falcon (seems) be to offering a helluva lot, for $700. Add a VGA
monitor, for $200, and a hard drive, for say $300, and youve got a killer
machine that would do lots of damage to your 'de facto' standards (IBM).

These are probably also the weenies who just want to boast to their
friends "Oh, my Falcon has a 50MHz 68040 with 128mb of RAM!". Granted
that there are applications that would require such, like very high
end graphics, but dont forget, that the Falcon is a _home_ computer,
and most people will probablty run simple apps on it; games are probably
the forefront, home accounting, MIDI of course since this is Ataris
niche, etc. If one wants to run 3-dimensional rendering, then they would
look elsewhere, such as SGI.

Myself, if and when I get a Falcon, I plan to run the same apps that I
do now: MIDI, telecommunications, and WP. Having a MIDI machine with a
DSP in it would be a great advantage. I can record my music via MIDI,
and lay in vocal tracks via the DSP (if indeed I planned on such a thing...
most of my music is non-vocal).

Atari could easily build up the Falcon 040 to meet such requirements,
but they would be beyond my price range. And again, there is the old
label that Atari has, for being a game company, and this, IMHO, is what
turns most people off.

One other thing, totally off the above topic, Ive seen many postings
regarding this empty socket in the Falcon, and people are hoping or
wondering if itll be for a 386 processor, and have IBM emulation
pretty much built in... My ideal would be to make it another 68030,
running concurrent with the existing processor. Imagine the media
reaction to such a machine? Duel processors under $1000? So far, as I
know, the only duel processor machines are _very_ high end ones, like
the Sun Sparc 10 (or whatever its called), and large iron, like VAXen.
Putting duel processors on the desktop would be a boost to Atari, and
put it over Amiga.

I 've heared that the next falcon generation will have 2 or more DSP's
connected to the main memory by one high-spee-bus for each dsp.

And - rumors about tomorrow say that there will be a big green
arkle desaster consuming the who universe ....

And - I really hate hearing nothing but rumors about something nobody has ever
seen nor hacked 'around with but which are useful to keep a certain company
alive that likes making you hungry for something that is just a cloud
of ideas in some developers' mind .

From: pinelr@aix.rpi.edu
Message-ID: <1hbyzhj@rpi.edu>
Source record: 218620

Hi there. I got so much help from my fellow Atarians in my searches for MIDI file specs and PD Minesweeper games, that I had to come back with another query! THis time I need some sort of a dump utility. That is, something that will let me view binary files as groupings of hex digits. I obviously can't use a text editor because trying to look at binary files with that puts a jumble of half fujis and quarter "Bob"s on my screen. SO, if anyone can tell me what a good PD dump utility is, I would be very appre-ciative. Thanks.

BTW, I need this so I can look at actual standard MIDI files and take them apart as sort of a black box thing. As much as I read, I can't seem to get a handle on this stuff.

Elvis 1.5 is the latest official release version. Version 1.6 is still
in beta release and shouldn't be widely distributed to people who don't
wish to deal with source code and report bugs. I've been using 1.6 since
about May and it does have various little bugs. It is very easy to port
to MiNT, since MiNT's libraries are so BSD-like (however, there are always
little things that need fixing here and there).

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
```

comp.sources.atari.st ! uuencoded/shar sources

:EMILY:
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of
humor.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways),
Emily has taken time out of her busy schedule to answer a few commonly
asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,

and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

What is Free-Net and how can I get access?
==

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

Mark Leair
Atari SIG Public Relations

:MAGS:
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011 Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning

of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window. (I've been told this will work on 1.2, and possibly other TOSi.)

:ZNET:
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)

:COMP:
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:FALCON:
What are the specs on the Falcon?

==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

Distribution is beginning soon in Europe, and by late October in North
America

:ACCEL:
Hardware Accelerators
=====================

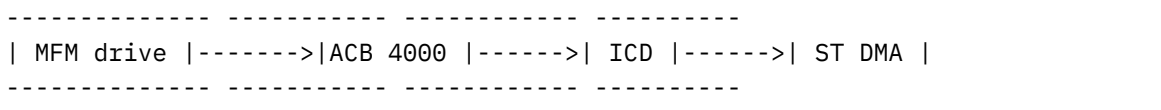
68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES:
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:



3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put the drive internally, you will need a case with power supply to house the adapter and hard drive. IBM case is very easy to get and has a lot of space for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive they use about 20 watts or less, Quantum LPS drive use about 10 watts each, make sure your power supply has more than the drives need. Again if you use IBM case, the 150 watts power supply for that type case can drive at least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL), it's 50pins IDC female connector on each end with 50 conductors cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome

* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?

==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that

a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

GEM on the PC was severely crippled due to some law suit with Apple. Like
windows can't be sized etc.. How Atari got round this one i don't know.
All the GUIs around today owe alot to Apple even if they don't admit it.
How comes the recoverable trashcan thingy in Neo got by the board for that
matter ? i'm fairly sure this was copyright Apple.

Adam.

Well, I tested this on my TT, and the bug showed up.
BUT in st-high-res it didn't show up, so probably it'll work
in TT high as well. Unfortunately I don't have a high-res monitor.
My guess is that Eric is using a TTM194 and thus haven't discovered
the bug (yet)...

dud@hardy.u.washington.edu (Daniel Aylward) writes:
>Bob gets his Internet access thru Compuserve; 70007,3240@Compuserve.com

Wrong. You have to take out the comma and replace it with a period.
That would be:

70007.3240@compuserve.com

for Bob Brodie at Compu$erve. Apparently he can also be reached at
Delphi (If he's ever there) at:

bobbro@delphi.com

I'm surprised that Genie doesn't get a net gateway installed.

From what I've heard from western Canada dealers, Geoff Earle,
now covers all eastern sales, including US, and Murry Brown, former
western Canada sales rep, covers western Canada, and nw US.

Both these guys have better track records at opening new dealers
to Atari, and keeping machines flowing to their deales, than their
former US counterpars, so in general, it could be an iomprovement.

Who knows, maybe you'll even see more Atari dealers in their
respective territories. At one time, Geoff Earle had more Atari
dealers in Toronto than the entire US east coast, including NYC.

>germany? (lowest hassle, and/or fees to banks)

To all those having trouble getting in touch with Martin Ibert.

As as been mentioned before, Martin has a job which keeps him on the
road a lot, and so, doesn't always answer his mail that quickly. To send him
money, I beleive the address in the 1.0 and 1.03 releases is still good. I
sent cash. Just figure out what your currency works out to for the DM
price, and add about 10%, to pay for any charges he incurs changing the
money at the bank. This is much cheaper than buying an international
money order or doing a bank transfer. This method would probably be
acceptable top other European shareware authors, but try to check with
them before sending.
I just wrap a bunch of old printouts around the $ to prevent it from
being visible through the envelope.

I think it might be more correct to say that all the GUIs around today owe a lot to Xerox PARC and not to Apple. I am, however, somewhat suprised too that Gribnif didn't at least get a "cease and desist" letter from Apple's attorneys.

Well, I don't know for sure but I think Apple may not have considered GEM
on the Atari platform to be much of a threat to their market share. At least
not big enough to justify any legal expenses they would've incurred. Now
IBM on the other hand...

>
Sam Tramiel specifically denied that there would be a trade-in/upgrade program.
He said it was against long-standing policy. Frankly, I don't understand.
Atari could trade a new machine at even a little above dealer cost for a
returned Atari computer; make money on it and get good will that no amount of
money could buy directly. This is essentially what Apple used to do with Mac
upgrades. They could recycle the cases and cut the boards in half and job
the halves out to surplus stores, if there's any question what to do with
bunches of obsolete computers.
Steve

1626. uucico and Hermes

Newsgroup: comp.sys.atari.st

I accidentally nuked the version of ppmtospu that I had on our Ultrix system and killed the sources at the same time. If anyone has a copy of this, it would be greatly appreciated.

If there is a version of ppmtospc out there or even ppmtosps that would be even better....

In article <1992Aug15.044657.442@mnemosyne.cs.du.edu> jyoung@nyx.cs.du.edu (Jeff Young) writes:
>
>486/33 only running at speed of 8 MHZ ST?!! Some people said it was
>supposing to run 2-3 TIMES faster! WHAT happened?? People said

Jeff, please try to understand that this is software emulation of the ST, if you have Quick ST, it should allow an increase in the speed which I read from the letter from Darek(or was it e-mailed). Anyways try doing a PC emulation of a AT machine on your so darling FALCON(Don't get me wrong, I'm in support of the FALCON even in the AMIGA.ADVOCACY newsgrp which seems that you are being flamed out of now). I had a 030-16Mhz machine before, believe me when I ran the AT emulator emulation of EGA, it was about 1.6 Mhz AT speed! That's quite useless in graphic intensive calls.

>Gemulator demo running run from 100% RAMDISK too and it is fooling
>everyone because real ST DMA is 2-3 TIMES faster than PC hard disk!!

DMA on the ST is 10 MegaBits which translates to about 1.25 Mbytes per sec. Will my ISA machine IDE HD does about 2 Mbytes per sec., that seems quite a different than your assumption (With cache its rating at 9 Mbytes per sec.) And if you had a EISA with SCSI 32-Bit card it's over 5 Mbytes a sec. (EISA + SCSI 32-Bit card is very cheap nowadays).

>What MIDI programs running now? Adlib is bankrupt and Soundblaster
>has very very terrible MIDI port and sound. Turtle Beach board

Seems like a subject of opinion

>Delphi report said Falcon is selling NEXT WEEK so Gemulator MUST
>faster than 68030 16 MHZ, DSP 56001. Also PC needs 8 channel

I hope its available here, love to see it!

>16 bit stereo too! Falcon already using local bus and very
>fast SCSI 2 so maybe 486/200 is needed???.

Why would say that Jeff? The cpu on the FALCON itself is quite slow at 16Mhz!

>Someone will please post benchmarks of Gemulator and Falcon?

The FALCON 030-16Mhz cpu alone is about the same as a 386SX20. I got this info directly from Mac Ads on their powerbook ads. They compared their 030-16Mhz 32-Bit(not the 16-Bit path like the LC II) to a 386SX20 running windows, well it was printed that the speed was about the same. So in saying that, the 030-16Mhz may be slower in reality to the 386-20SX since their benchmarks ran it on Windows 3.0 instead of OS/2 2.0 32-Bit OS.

Does anyone know where I can FTP the latest version of SuperBoot? I think 7.2 is it... It doesn't seem to be on atari.archive.umich.edu...

Also, I don't log on to GEnie. I would like to have the new fontGDOS, but as far as I know, it's only available on GEnie. I have the small version, that was supposed to be distributed with AEO, but I need the big version with all the drivers. I would really appreciate it if someone could at least tell me where I can get it without paying for GEnie...

Thanks,

Dan Aylward

1631. Quickie FAX software sought

Newsgroup: comp.sys.atari.st
Date: 1992-08-16 19:01:52 UTC
From: slick@netcom.com
Message-ID: <x18m5g=.slick@netcom.com>
Source record: 218643

OK, so now that I have splurged and bought a Supra FAXModem V.32bis from my local Atari dealer and have seen the light of way-fast modem speeds, I am left with the nagging question in my mind: does the fax part of this puppy work too? After all, I have only five years to find out before the warranty runs out. :-)

So I place it before the assembled throng: is there a quick/easy/cheap fax program for the ST by which I can send some simple file to a fax machine, and perhaps even receive a fax from said machine? I have no dtp programs with which to compose a fancy page, but I can gin something up with Degas or I can create a PostScript [tm] or .dvi file on another system and get it to my ST.

Suggestions?

That was just the PC-GEM _desktop_ 2.X. The program's windows can be sized,
although.

>How Atari got round this one i don't know.

They got the licence from DRI early enough to be not concerned in the legal
conflict.

The only existing piece of faxmodem software that I am aware of is STraight
Fax from Joppa Software (717)428-3231. It is capable of converting ASCII files
along with any GDOS files. It doesn't do background faxing and it doesn't have
a printer emulator. For occasional faxes it works great for both send and
receive.

>supported well enough over here, so only a few were selled !

Being an owner of an Archimedes 310 and an Amiga 1000, I have to
tend to disagree here. The hardware in the amiga 1000 is better than that
in the Archimedes. However the Amiga hardware is looking very 'deadend' now
because - CBM just don't seem to be supporting in properly.

>So I don't think that many people will buy the Falcon 030.

Tend to agree here - from what I see Atari seems to have very little
marketing outside of the uk (and maybe de?). Just remember how the C64
outsold the old atari 800's by a factor of about 4-1, due to poor marketing.
And how the Atari ST, outsold the Amiga in the uk - in the early days.
Marketing, software, and support *is* the only way computers sell -
unfortunately Atari just don't seem to have it - which is a bit of a shame
seeing as the Falcon has more going for it than the ST did.
(Not that that is saying much ;-))

< Log deleted >

I've seen that kind of reports on a really dirty line. Other than
that, I don't know what your problem could be, as I hooked the new
uucico into hermes today and it works fine. Also, it works under
MiNT (or so the docs say, as I haven't tried it yet.)

This mainly sems to be a problem with the Atari ST port, but..

Does anyone on mausnet know who actually did this port? Also, does
anyone know where to get the *nix installation docs, without having to
ftp the entire nn release?

I've gotten buildact to work, though the active file it writes causes
hermes' rmail to put all active groups in junk, so there must be a way to
keep 2 active files around, one for nn, and one for hermes. Also, I've
found that the nnadmin program, called without parameters, gives a menu
with lots of options, and nnmaster also will create a database. However,
no matter what I do, starting nn gets me no news to read, just the
"no news is good news" quote and then exit. Any suggestions what I'm doing
wrong? I can't seem to find a way to get nn to display the currently
active newsgroups or allow me to read them.

I don't have the last ad I read, but hopefully I'm remembering this correctly...
Speed: 40Mhz (50 Mhz if the virtual memory option is also puchased)
RAM: 32K (I think) cache
No way to add additional memory
It will fit in a 520.
Price: $999 (they had a $599 intro offer, but I think this expired long ago)
virtual memory option--$299 additional
there was also another option available, but I can't remember what it was

>acceptable top other European shareware authors, but try to check with
>them before sending.
> I just wrap a bunch of old printouts around the $ to prevent it from
>being visible through the envelope.

Bank transfers are somewhat expensive (25$US) but are reliable and fast.
When my wife heard about my attempts get money to germany, she reminded
me of international money orders from the US post office. they are
fairly cheap (~2$) and available in the currency of your choice (or
at least that is what my wife claims). I'll update the net as to what
I find. (the things I go through to pay for shareware) I wonder
if martin is interested in a north american rep.

and now on to the hermes questions:

I just converted over to hermes after living with mercury for the past
2 years. It took all day but now I have an acceptable (and probably
not optimal) configuration. But as you can guess, I have some questions.

I have not run pathalis because I have only one connection and I
keep getting file usr\lib\mail\paths" not found messages. what is a good
dummy file for paths and mdbs files?

Another warning is it can not tell what my modem type is. I suspect I
am missing a database somewhere. clues?

when I run nhm and try to regenerate the history files, I get can't
open any more files error messages. could this be due to some 0
length files in my news spool area? (I got them when I overflowed
my disk when I had a large burp of news).

Thanks for any info.

--- eric

BTW, if you answer by email, use the polaroid address below. my feed
is at risk of vanishing in the near future which will invalidate my

.us address.. so if anyone knows of any friendly feed sites that
are willing to feed me mail and news PLEASE TELL ME! a net connection
is a terrible thing to lose.

>>Someone will please post benchmarks of Gemulator and Falcon?
>What's the point..?
>Gemulator is an ST emulator, not a Falcon emulator..

Don't forget to also mention that as far as the Falcon is concerned it has not been seen by any U.S. Atari users that I know of. It wasn't present at the Toronto show, not at the Indianapolis show, and it sure as heck wasn't present at this weekend's Connecticut show. Bob Brodie did show up, but all he brought was Lynx machine. OH BOY!!!!! And Bob Brodie, shame on you for not even having the courtesy to show up at the banquet on Saturday night. I guess you were far too busy to mingle with users and developers who each shelled out $26 for "dinner", which to me looked like cold cuts and bread.

Jeff, tell you what, when YOU personally manage to buy a Falcon, please, oh please, do tell us how much you paid for it, and do post benchmark results. I'm sure the Falcon will run circles around a 486 running Gemulator. No dispute there. But until you can buy a Falcon you shouldn't really compare an invisible vaporware machine that almost no one has ever seen vs. an Atari emulator that has now been seen by about 4000 Atari ST users and which goes on sale in under 4 weeks.

Having the brouchure for some time, and in need of a portable ST without lugging around an LST, where can one get an STBook, if they have been released?

Although I love my Portfolio, you just can't do heavy word processing like I do with my desktop STs.

I tried out different fonts and different fontsizes. The problem is worse
with small fonts and occurs less often with bigger fonts. Using a 26pt-font
it didn't show up at all.

BTW, I'd like to have saved not only rows and colums but also the scrollback
amount in toswin.cnf.

1650. Question on Protar Series II, PC-Ditto and TOS 2.06

Newsgroup: comp.sys.atari.st
Date: 1992-08-17 09:27:07 UTC
From: mr3@ukc.ac.uk
Message-ID: <1467@eagle.ukc.ac.uk>
Source record: 218661

Hallo Atari people. I recently posted the following for a friend
but he got no replies :-(So here it is again, in the hope that some
kind soul will help him out:

I am going to buy a Protar Series II 100M hard disk and am thinking of
upgrading my operating system from TOS 1.2 (UK) to TOS 2.06.
Has anyone encountered any problems running the pc-ditto software emulator
with TOS 2.06? Does pc-ditto work with the Protar drive?
My ST is a 1040 stf. Does TOS 2.06 (the USA version) work on a british
machine or are there any problems?

I can be contacted at cmeli%panther.uucp@carla.dist.unige.it

Clyde

Please send replies to cmeli%panther.uucp@carla.dist.unige.it but
if the mail bounced back then send it to me. Thanks,

Mike

STOS.

The PD STOS extention STOS TRACKER allows you to play Amiga AMOS .ABK tracker modules from STOS. It includes a converter from Noisetracker .MOD to AMOS .ABK (so you can play Noisetracker modules, too). It is available from most UK PD libraries. If you have any problems getting hold of it, mail me.

>
> Adam.

This is simply wrong. The only thing that was crippled was the desktop. The AES was even extended. Most people I knew at that time continued to use the old desktop in top of the new AES.

Nowadays, DR has a realtime multitasking OS called Flex/OS with a multitasking version of AES on top (X/GEM). So both GEM lines (PC and Atari) are still supported.

Keep in mind that Cypress (I believe it's them) makes a wonderful
chip called the 486SLC. It is made to drop right into a 386SX slot. I
imagine that anywhere a 386SX could be put you could use one of these
instead. It will still only access memory in 16 bits of course but it
should still provide excellent speed (for an emulator) !

Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.st

Can anybody recommend a good flight sim for the ST?
The ones I already have are...

Falcon (+mission disks) Sublogic FS II
Thunderhawk F-29 Retaliator
Flight of the Intruder

I am looking for something with an accent on realism, like Falcon, but with
decent graphics, like F-29 or Thunderhawk. Can anybody give me recommendations?
In particular, I am interested in..

Knights of the Sky
F-15 Strike Eagle II
Birds of Prey (is this out yet?)
Battle of Britain

Any help would be appreciated.
Thanks very much

>
> Could you double check that?

You're right, but, in my typical half asleep way, I thought we were
talking about 9600. What is v.32bis? Is it a kind of data compression no
high speed modem should be without, or is it the 14.4k protocol? What is
their voice upgrade, and will it affect the modem/fax capabilities? And,
why do I ask since I never have any money?

Also, I was off on the price by $30 (its 239, more with PC software).
I learned this when I single checked.

This might have been true at one time, there used to be lots of dealers
in Toronto. But being in Toronto myself, I can assure you there are very
few left. There were a few stores that were Atari-only (probably a rarity
in the US!) but now they sell PC's and have a handful of Atari products
in the back corner somewhere. It's pretty grim now. I mail-order everything
now, usually from Toad Computers, which is very good. Their catalog is
amazing, for anyone who hasn't seen it, it's like 50-60 pages of everything
in the world for Ataris, hardware and software.

>MiNT (or so the docs say, as I haven't tried it yet.)

Ive (sorta) solved the problem. I used RTS handshaking (appeneded an
/R to the baud), and it works. Now that last minor problem, which I
wont worry about, but will mention. $USR/adm/uucico gave me all status
reports, and finished OK, but in $ETC/xhosts, it tells me that a
successful connection has never been established...

Now all I gotta do is remember my mail/news feed info :-) (I since
sold my old mail machine, and dont recall the phone number, or
password!)

Thanx!

This sounds amazingly like an Atari-sized version of the Tandem T16 NonStop architecture that has taken Tandem Computers to a dominant position in fault tolerant computers and transaction processing. This would NOT be a trivial development effort, but WOULD result in a potentially killer machine. It would NOT fall into the price range wherein Atari has traditionally been reasonably successful. I would certainly like to see it happen. So who's going to tell Sam T.?

You may very well be right. Although, I would say that the author more likely just wanted to share a little bad news and tech some people a lesson about what happens to companies with CEO's who supposedly don't change with the market. It's more like an "I told you so" article.

And nearly everything you know and love regarding the Apple Macintosh WIMP interface was derived from the Xerox Star and work done by Xerox PARC long before the first Mac saw the light of day. It is not a coincidence that Alan Kay worked at PARC for many years before coming to Apple to assist with the development of the Mac for Steve Jobs.

What discussion? I've been checking news.groups for a couple of weeks, now
and haven't seen a single article about comp.sys.atari.znet!

Am I the only one missing this discussion?

[idea of making a 68k based multiprocessor Atari machine removed]

This sounds like a good idea, except:

1) The 68ks were not built for multiprocessing (big surprise) - you are not only talking about totally (almost) re-writing TOS to handle the multiple processors (which sounds like a good idea to me anyway), but you would have to implement some impressive glue-logic to get the multiple processors to work cooperatively since they a) don't know that they don't own the bus, b) don't understand any kind of memory but super/user, c) only have 24bits address line (and you really want to be able to share some of the memory so you can at least pass information between processes/virtual machines).

2) Related to the last point of 1), you really want to have a distributed multiprocessor-system - how many times do you run 27 applications simul-taneously? Not to mention that each processor would have to have its own memory - and it doesn't sound too appealing or marketable to have to buy 27MB so you can have 27 1-MB virtual machines. That and the fact that each would still be going at the original (single processor) speed. By having a distributed multiprocessor system, you distribute tasks over the multiple processors so that you can have (with properly written software) a (several) programs executing in parallel over as many processors as is possible/feasable. Therefore, you get a faster execution time with a slower (=cheaper) technology.

My suggestions:

To address 1) above, use a 68040 as a minimum - you need not get a faster one, (<=25MHz should be more than enough, and with the '040/33, prices should be dropping) - this would be an excellent choice of multiprocessor as it has built in cache w/cache snoop (if something on the bus requests data that is cached on the '040, it supplies the data), MMU so that memory can be partitioned however needed (ie. processor N's memory, sharable, etc.), and it can address 32bits of dataspace so that a huge chunk of memory can be partitioned dynamically to the processors. Most importantly, the '040 does not bus-master the bus - it requests access to the bus just like any other device on the bus, thus making it nice for other processors that might be present.

So how does that sound? Atari - feel like making some low-cost multi-processor workstations?

-Mike

>(about that) a new board is out which now goes up to 64MB.

Hi!

I am curios about the new board. The old one had 2 banks of 32-bit wide memory, up to 4MB per memory location. Will the new board handle 4 banks (the easiest way to 64MB) or will it actually be able to support 16MB chips (neccesitating the existance of only one bank)? BTW, have they sorted out all of the incompatibilities they were having with the older TTs?

>imagine that anywhere a 386SX could be put you could use one of these
>instead. It will still only access memory in 16 bits of course but it
>should still provide excellent speed (for an emulator) !

Hi,

I believe it is Cyrix that makes the chip, and that chip is (I believe)
32-bits wide. It gets upwards of the speed of the 486sx (which is 32-bits) and
I can't imagine it performing that well on a 16bit bus. But you are right, its
supposed to be pin compatible with the 386 (not sx).

However, this would still require a 32-bit bus slot to work from. Come
on, who gets serious speed out of a 16bit bus anymore (relative)? It would
be ridiculous to expect serious coprocessor/alt. processor support out of
a 16-bit slot, hence being "troubled" by the constant 386sx references.
Could someone at Atari PLEASE! either confirm or deny this?

I will be moving to California in a month and need to find out where I can go to get good support of my beloved 520ST.

I need the names and addresses of dealers in the Los Angeles area. I will have a car, so distance (< 75 miles) is not really a problem.

Thanks in advance!

Dom (alvear@cs.jhu.edu)

> exactly one process each, in parallel, than you could with one 68020
> running and switching between 27 processes, executing no more than one
> instruction at a time (for roughly the same amount of money)?
Two problems:
- (1/2) stuff that much electronics in a little box
- (1/2) supply enough electricity without melting the box
- (1) let 27 microprocessors access the main memory
simultaneously

(the first two are marked 1/2 because the can be easily fixed: ;-)
- get a bigger box
- get a better power supply

There also is a simple rule:
The more chips, the more bucks!

It's not only the chips that make this, but the mainboard design.
You need local memory, cache, or something else.

> Consider what a great product Atari could have, flying into the twenty-
> first century at low cost, if they could write an operating system that
> is based upon the architecture of one microprocessor for each process
> that can run.
That's it!
IF THEY COULD WRITE IT!
If I sometimes take a look at some parts of TOS and the current
bugs, I doubt!

They're available in Europe for the most part, in one meg versions. Bob Brodie said that Atari US didn't feel one meg was adequate and that they were going to wait for the four meg version. When that comes, who knows.

One of the local dealers obtained an ST Book from an Atari employee who didn't want it any more, but promptly sold it. Perhaps you could inquire at Atari Corp.

You may also want to look into getting a DOS notebook or a PowerBook 100.

While we're at it, let's revolutionize the automotive industry by combining 8 used Volkswagons (each might cost $400) to create a car with the power of a Ferrari, for only $3200!! Yeah!

Parallel processing machines have been the dream whose idea has never quite come, perhaps because it is easier to create the hardware than to write software that effectively uses it. Wasn't the Atari implementation of the transputer intended to be a super-powerful multi-processor machine? How many of those were sold?

Roger has got a point though. I ended up setting up my BBS on a PC with a
200Mb hard drive for less than the retail price of an Atari 40Meg HDD.

Quite frankly, the best machine in the world is not going to sell if it's
overpriced and not supported. The information I have received from
several retailer around New Zealand is that the Atari agents are actually
actively trying to drop the machines...to the point where I have been
asked to repair machines *still under warranty* as they could/would not
be fixed by the N.Z. agents.

1679. fast modems

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 01:32:42 UTC
From: dogbowl@dogbox.acme.gen.nz
Message-ID: <81HNPB2w165w@dogbox.acme.gen.nz>
Source record: 218676

The discussions on fast modems have me wondering....

In a previous posting I mentioned that I set up a BBS on a PC for the simple reason that it was cheaper to do so.

That BBS uses a ZyXEL modem (Sysop deal, so I should mention it) which is capable of 14,400 uncompressed. It will literally scream along at 56000 bits per second on uncompressed files, and is capable of going faster (it has a couple of higher speeds talking to another ZyXEL).

On the horizon I see glimpses of modems which are capable of 28,000bps *uncompressed*! I hesitate to think what they'll be capable of doing when compression kicks in......

Question time...

1: What defines a 'fast modem'
2: Will the new Atari machines (Falcon et al) be able to keep up with these sort of speeds?
3: How long before 2400bps modems are relics of history?

I cast my vote with Bammi. As far as windows, you don't have to
actually top the window, just make it active. An option for this
would be wonderful. I changed my copies of unix windows and MW2
to add "point-to-type" (as opposed to "click-to-type") options.
It really makes them much more usable.

I've opted for the easy way -running MiNT from the AUTO folder, and have TOSWIN.ACC in the main directory. Works okay, and 1. My keyboard doesn't wear out from typing all the CLI routines, and 2. I don't have to try and remember all the routines/commands etc.

1688. New goodies for Ghostscript users.

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 06:19:45 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <77932@ut-emx.uucp>
Source record: 218553

Some new Ghostscript stuff is available for anonymous ftp
from lifshitz.ph.utexas.edu in pub/ghostscript.

gemgs10.zoo: A GEM shell for Ghostscript. The only real
advantage this offers over the command line is
the ability to pick selected pages from large
documents for GS to render. Unfortunately, this
feature is slow. It is fun to play with though.

gs241r1.zoo: gs 2.41 Atari revision 1.
This differs from revision 0 in only 2 respects:

1) The screen driver supports windows, for use
with gemGS, or from the command line.

2) The executable includes an NEC P6 360dpi driver,
which several people have expressed a desire
to have.

gs241dif.zoo: Diffs for changes to the ORIGINAL 2.41 source.

It just remembered that I haven't tested gemGS or the window driver
on color screens--oops. I think they will work, but I am sure
people will let me know if they don't.

Does anyone know if things are getting moved out of the new directory at
atari.archive yet. If so, I will upload all this stuff to atari.archive.

-Tim Gallivan

>
> Has anyone successfuly installed mint and have NeoDesk3 up and running?
>

Hi Scott,

this is an old problem: NeoDesk refuses to start if MiNT is active.
Having MiNT 0.94 installed, you could start Neodesk in the following way:
- start MiNT in the Auto folder
- start GEM from MINT.CNF (last line = #INIT=)
- start mintshel as an AUTO application
- start Neodesk from mintshel.rc by the last lines:
cd $NEODESK # here lives Neodesk
neodesk.exe # not neoload.prg !!!

But this does not work with MiNT 0.95 !!!
You have to initialize MiNT, GEM, your environment (by mintshel) and then return
to the normal desktop. Now you will be able to start Neodesk as application.

Strange, but this method forks fine for me...

BTW: I am thinking of replacing Neodesk by GEMINI if no new Neodesk version
is launched on the atari fair in Duesseldorf as last year...

This is ONLY false rumors.
New Amigas will be announced when they are available.
Although the new amiga machines & OS are already been in the hands of
developers for many months, they will only be announced when ready to be
bought,
unlike the Atari policy for the falcon.

>an invisible vaporware machine.... [stuff deleted]

Just out of curiosity, at what point does something become
"vaporware"?
- Is something vaporware from the time it is announced until it comes
out?
- Or is something vaporware if it is announced and misses a deadline
or two? (like FSM GDOS).
- Or is something vaporware if it is announced and never comes out?
(like the 1450XLD which I wanted so badly..:)

And how much does rumor count in something's vaporware status. I
thought that vaporware was something that just didn't ever come out.
(or doesn't seem to.)

Just wondering.

You should definitely read the termcap.texinfo manual that comes with
GNU Emacs. It tells you more than you ever wanted to know about
termcap, and it also says why it's a good idea to use the GNU termcap
library. (It *is* a good idea, really.)

The `man 5 termcap' idea is also good, although the manpage is *much*
more concise than the GNU manual. Given that the manpage is a
reference tool, this is not surprising.

You could also look at the source code for any curses library.

Hope this helps.

Well, parallel processing machines ARE the state of the art in computing
nowadays,
if you don't believe me, I would recommend you reading the last? issue
of BYTE,
where there is a discussion of parallel processing in connection with
office
computing.

Since I have never programmed any parallel processing machines I won't
make any
statements concerning the simplicity og lack of it, but those at our
institute that
uses Cray, says it's no big deal, nowadays. As long as your program can
be vectorized
it should pose no big trouble. I'm talking here about scientific
calculations,

I guess Word-procs should be a bit worse.

Jarle.

>(Or else maybe I have corrupted files)

Is your shell using argv? Does your sed understand it> Try
another sed. I think mine came from atari.archive.

It doesn't make much difference until I figure out hoe to get
nn to notice there's some news to be read.

Does anyone know if there's an nnadmin command to open the groups.
One command I tried reported all the groups as BLOCKED, even though I
set my permissions for "read any time" TFM says BLOCKED means that nnmaster
is working on the database, but it wasn't even running. Is there a way
to unblock the groups? I thought of trying to figure out which bit in
the field indicated the group was blocked, but that seems a rather kludgy
way of dealing with this.

Maybe nn only works under MiNT. Have to go looking for MiNT traps, I
guess.

>> These are my arguments against the new group.
>
> Thanks for your input John, maybe you would like to post this in
>news.groups with the rest of the discussion.

As several other posters have pointed out, there is no discussion
in news.groups. This could be because your crosspost was mistakenly
posted to _news.group_, as someone else pointed out, which means any
discussion would likely be going on in most systems junk directories,
unless they have just dropped it on the floor.

Also, if you check the newuser postings, you'll find an article
called "How to create a new newsgroup." This will give you all the
suggested guidelines for creating said group. Another suggested
source of interest is the " What is Usenet posting ".

One other thing. Two actually. You will find that an RFD will not
be considered real until it has been mailed to tail@rpi. Secondly, on
splits and reorganizations, it is customary to at least have a bit of
discussion on the affected groups before issuing a RFD, so a well thought
out charter and answers to the various questions that will be asked can
be answered.
Most of the questions I brought up in my original post are fairly
stock for news.groups regulars, and better answers are needed if you want
a snowball's chance of getting the group passed, which I think is unlikely
at best. In your proposal, you showed no reason why the new group would
be any different in substance than c.s.a.st or c.s.a.st.tech.
Why don't you just gateway the znet feed into c.s.a.st? It's not like
we're drowning in messages as it is.
Or better yet, gateway it to a mailing list, and let those interested
subscribe.

1703. STOS MOD player

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 12:03:51 UTC
From: evilandi@VNET.IBM.COM
Message-ID: <9208181146.AA23785@ucbvax.Berkeley.EDU>
Source record: 218569

Several people have asked me to upload the STOS TRACKER extension to the net.

Unfortunately I am netting from my workplace at IBM Warwick, where we have
a diskless office. I do not have access to the net at home.

So here's one of the many UK PD libraries it can be obtained from:

GOODMAN ENTERPRISES
16, Conrad Close,
Meir Hay Estate,
Longton,
Stoke On Trent,
Staffs ST3 1SW UK.
Tel: (+44) (0) 782 335650
Fax: (+44) (0) 782 316132
Visa & Access (=Mastercard) are acceptable.

The UK price is 2 pounds 27 pence sterling, but I'd expect to pay a little
more for overseas shipment.

Tell Mike Goodman that Andrew Oakley of the Gothic Domain sent you. Goodmans
are the official STOS Shareware Service (previously run by Sandra Sharkey).

And now, a plug; my latest puzzle game, Square Off, is on this months'
(Sept) ATARI ST REVIEW cover disk (I have already been paid so I am
making no more money by plugging it, OK!).

Andrew Oakley (Evil Andi of Gothic Domain Shareware) EVILANDI@VNET.IBM.COM
IBM Warwick, UK (I speak FROM IBM, not FOR IBM)

Q: Why do Yanks say "Zee" instead of "Zed"?
A: Because they'd never remember the alphabet if it didn't rhyme.
(UK trad.)

Jarle.

Vectorising is a technique for speeding large chunks of arithmetic, such as matrix addition. The Cray supercomputer is designed for large number crunching, and does it very well. What I have not heard of is a parallel architecture good for interactive programs such as word processors and art packages. Though these could be split between several processors, I don't know of any useful way to make them scale so that doubling the number of processors doubles the performance.

- Adrian

1706. Help: microemacs problems (I think)

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 13:25:36 UTC
From: strgh@warwick.ac.uk
Message-ID: <kq0nbskh@csv.warwick.ac.uk>
Source record: 218574

My ST has just been upgraded to 4Mb and TOS1.4, and I'm having problems
with micro-emacs (both versions 3.9e and 3.10). On starting u-emacs,
or after reading/writing files (^x^w etc.), the screen fills with zeroes
(at approximately keyboard-repeat rate) until I hit a key or mouse button.
I can then delete the zeroes & edit as normal.
Problems remain with filenames even after quitting u-emacs, e.g. the
command line on any .TTP application also fills with zeroes until I
hit a key or button. They're OK if I haven't previously run u-emacs.

As far as I can tell, only u-emacs is so afflicted. Every combination of
bug fixes (POOLFIX[34], Atari Rainbow TOS patches) and my preferred Auto
programs & desk accessories (including none) has no apparent effect.

Can anyone out there suggest a diagnosis or cure? U-emacs was fine with
my old TOS1.0, and I'd like to continue using it. Please e-mail me;
I'll summarise.

-- Ewart Shaw

P.S. Please also e-mail me if you want to add to my list of `recommended
configurations for start-up' - what desk accessories and Auto programs
do you use? I'll be summarising responses in a week or so. Many thanks.

1707. Help: broken condensator

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 14:02:45 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1992Aug18.140245.9126@daimi.aau.dk>
Source record: 218576

During a RAM upgarde, I have accidentally broken one of the condensators, and I would very much like know if anybody can supply with the correct type so I can replace it.

It is a glass-condensator with the number C10 on my C070789-001 REV.D motherboard. It has apparently no colour-coding, but the tips are orange and the middle of the glass coating is transparent while the condensator itself is black (square) with silver connections on the ends.

Does anybody have any information on this? Could I perhaps grab one of the condensators from the blitter-chip (which I don't have anyway)?

Christian Lynbech

Yup, I think 7.4 is the most recent version, but the newest version on a.a.u.e is 7.2 (in the utilities directory, called (I think) supbt7_2.lzh or something) whilst 7.4 was on the coverdisk of a recent ST Format. I'm not sure what the differences are though...

1709. 16 MHz / Overscan questions

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 14:32:41 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Aug18.143241.5623@aston.ac.uk>
Source record: 218577

Well, I'm contemplating squeezing some more hardware into the guts of my ST and I wondered if anyone could give me some advice. The two upgrades I'm currently considering are...

A cheap accelerator board (probably 16 MHz 68000) which seem quite cheap,

The PD Overscan mod, which seems incredibly cheap!

The things I'm concerned with are mainly (1) performance and (2) compatibility with the software I'm using. Firstly, what kind of speed increase do you get from the accelerator? Will it significantly speed up window drawing, number crunching and the like? What performance do people get from things like packed executables/ archives being uncompressed, ray tracing programs, screen redraws and the like? Is it worth coughing up more cash for a 25Mhz or even faster?

Regarding Overscan, does it slow down the computer significantly when it's running? If so, how much? There's also a hardware kit over here in the UK called the "Autoswitch Overscan" which (I think) fits into the monitor (Hi res) and costs 50 UK pounds- as I almost exclusively use Hi-res this would be equally functional for me, so does anyone have experience of this? Is it better/worse than the PD overscan hardware mod?

Compatibility- I play a few games in colour, but presumably both these mods can be deactivated so that shouldn't be a problem (should it?) but in hi res I'm using (or planning on buying) Neodesk 3, Steinberg Cubase, Spectre GCR, and numerous ray-tracers, graphics programs, and STOS. Anyone have any experience of how these programs work with 16MHz / Overscan modes?

Anyway, thanks for reading all this, If I get much feedback I'll post a summary. Cheers...

Message-ID: <1992Aug18.143713.5706@aston.ac.uk>
Source record: 218578

Hmmm... You don't see much about games on this group, but since this is an acknowledged classic I thought I'd break with convention.
Are there any Dungeon Master addicts/ expert hackers out there who know everything there is to know about DM? If so, I'd like to hear from you, as there are still things I don't fully understand even after completing the game about 15 times (I did say addicts!) such as...
What do various objects do (Ekhard Cross, Rabbit's foot)
What advantage do you get from having a full set of Armor of Darc/Lyte
How is damage / armor calculated- why are some weaponds better for some monsters and others for other monsters?

Does anyone else even care? Oh well, sorry for wasting bandwidth ;)

>Well, to be frank, your opinion isn't worth too much. If I mention 'economy
>of scale' do your eyes glaze over? Try networking any other small-market
>system and see if you come off that well.

It is possible for a 1 MB machine to serve at least five or six further ST
(with dedicated server software). What we did (began as hobby, now almost
finished and quite a complex system): Transfer via the printer port (with
about 400 Kbyte throughput parallel), dedicated server with new operating
system, own file system (extended attributes, user management) and tools
for administration (cron, mail, batch processor, loadable user overlays).

Our problem is that we've an almost complete and quite complex system running
here, but we don't have much documentation ready and so we cannot give it
away. The other point is that a network will always be a commercial product;
there's some hardware behind it and institutions setting up a network want
to have support when they've got trouble with their installation etc.

If you're interested in further information or a demo (1 client, 1 server :-),
just send e-mail to me. Please don't regard this article as "commercial".
We don't have a distributor for it.

Waiting for flames...
Daniel

>>Am I the only one missing this discussion?

>What is there to discuss? There is no question it should be done!

Sorry to disappoint you folks, but reading news.groups for almost
8 months now I didn't see the RfD there. I also checked David Lawrence's
recent status messages - there isn't mentioned any atari group.

So - if you want to create a group in a main hierarchy like comp you have
to get posted your RfD at least in news.groups and news.announce.newgroups.
I said "get posted" because n.a.n is moderated and therefore you have
to send your RfD to the moderator.

For details see the "How to create a New Newsgroup" posting in
news.announce.newusers.

Regards

1715. Falcon tinkering thoughts...

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 15:57:22 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Aug18.155722.27123@u.washington.edu>
Source record: 218582

Can anyone who's seen a Falcon tell me how easy it would be to pull out the motherboard and put it in my Mega STe? I don't want to give up my separate keyboard. I have a Maxtor 7120S SCSI 120 meg drive in it now; I'd probably have to rig up some funky way of connecting it internally to the SCSI port... have to cut different holes in the back for the different ports... How about the keyboard? Could the modular jack be directly wired from the old keyboard wires?

The other thing is if I were to get a Falcon (whether or not I put the motherboard in the Mega STe case) would I be able to run mono-only programs like Calamus 1.09n?

Thanks,

Dan Aylward

1717. elvis 1.6 `beta' for TOS/MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 16:10:29 UTC
From: d09c@alf.zfn.uni-bremen.de
Message-ID: <d09c.714151872@alf.zfn.uni-bremen.de>
Source record: 218583

ok, here it is... :-)

elvis 1.6 for the atari is now on ftp.uni-paderborn.de [131.234.2.32]
in atari/MiNT/mgnustuff and on wowbagger.pc-labor.uni-bremen.de
[134.102.228.9] in incoming/atari/mint (should move to
pub/atari_st/mint). filename is elv16beta.zoo.

note this is *not* an official release, so don't blame steve if
something goes wrong. but i am intrested in your comments of course...
(i use it now for about 3 months and apart from one rare redraw problem
that was also in earlier versions i have fixed only 1 bug since then.
so it is quite stable...)

here comes the readme...

------------snip-----
From: Juergen Lock <nox@jelal.north.de>
Subject: elvis 1.6 for MiNT/TOS -- readme

[^^^^ so you can easily reply]

due to popular demand :-) and because its still some time until this will
appear in an official release: here is the current state of elvis on
MiNT/TOS. features:

0. this is an *inofficial* version. even the original 1.6 src it is
based on you won't see posted somewhere... next will probably be elvis
1.7 appearing in comp.sources.reviewed. (but still without this MiNT
stuff built in.) so if you find problems and bugs don't bother steve
with it (yet), they're probably mine anyway. :-)

1. runs fine on both MiNT and TOS, but needs MiNT libraries to compile
(and also probably gcc). i have left the #if TOS stuff in (my patches
use #if MINT) but you should use that only as a last resort. (the MiNT
version runs better even under TOS.)

2. behaves itself under MiNT. that includes stuff like not busy-wait on
the terminal, use pipes instead of tempfiles etc... (looks at the __mint
variable)

3. and of course shell escapes etc work like you would expect of a vi.
:r !ls -l ... !Gtr -d '\015' (but see 6. :-)

4. uses -ltermcap. (that one was easy...)

5. uses the `special key' mapping of the messdos version (see docs)
and also maps the shifted cursor/insrt/home keys wich would otherwise
give digits. some of the keys can also be defined in the termcap entry,

if that is found a default mapping for the others is used.

6. new options: crlf (read/write \r\n, can be changed anytime) and
stbios (screen io thru BIOS, default on TOS, off with MiNT).

7...and varios fixes and other thigs i have forgot.

here is the termcap entry i use on the console...

```

>another sed. I think mine came from atari.archive.

I was trying to use the Gulam shell, switched over to the HUSH shell, and
at least got sed to run. It just ended up copying the active file anyway.

I presume the active file is supposed to end up looking like a '.newsrc'
file?

Can you post part of your active so I can see what the format is supposed to
be?

Or how about posting your active and /.nn/master (uuencoded if it's binary)
and I'll set my system up the same way for testing.

How do you get the /.nn/master file created? If I can at least get that file
created and get to the point you're at, maybe I can discover something that
will help us both.

> It doesn't make much difference until I figure out hoe to get

>compression kicks in......
>

Well, you said above that it will do 56,000bps uncompressed, so I guess the
horizon isn't too far away. :^)

From what I understand, before modems get significantly faster, we're going
to need fiber optic lines.

>Question time...
>
>1: What defines a 'fast modem'

Your needs. Some people may think 1200bps is fast enough for them. I have
a Supra V.32bis modem here and now I think it's too fast since my only other
local 14.4kbps connection went bye-bye recently.

>2: Will the new Atari machines (Falcon et al) be able to keep up with
> these sort of speeds?

The "old" Atari machines, like the MegaSTE and TT, already support astronomical
speeds on their second through fourth modem ports. STalker is the only term
program I'm aware of that supports those faster speeds. (Maybe Rufus too,
or Connect?)

>3: How long before 2400bps modems are relics of history?

Are 300bps modems relics of history yet?

I don't know, some people still use MS-DOS, so I guess 2400bps will still be
around for a while. :^)

Hi. I was wondering if there was a program out there, whether in PD or (more likely) commercially that is similar to the IBM program AUTOMAP. AUTOMAP, for those of you who don't know, is a program which basically plots out the best routes to take on US roads between any two given points. If there is anything remotely like this for the ST platform, I would love to get it. Email or post if anybody knows if such a beast exists! Thanks!

1726. Falcon Resolution, Audio Sampling

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 18:18:46 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1992Aug18.181846.3658@riacs.edu>
Source record: 218590

I know that the standard resolutions that the Falcon supports is no higher than 640 x 480. But isn't it possible to go up to something like 1280 x 1024 or 800 x 600, with a video card and SVGA monitor? I was told by a local Atari dealer who had seen the Falcon that this was the case. I'd love to fantasize about getting one, but I'm afraid that higher resolution is a principal concern of mine.

Also, does anyone know if there there is anyone presently developing sample editing programs that use the Falcon's sampling capabilities?

Muchas Gracias

1727. Will there be NoiseTrackers for the Falcon?

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 18:33:20 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <1992Aug18.183320.122315@rrz.uni-koeln.de>
Source record: 218592

Hi folks,

in that c't article about the Falcon (issue sept. '92) I've read
that the Falcon was capable of producing sound in stereo CD
quality. The only serious limitation they talk about is mass
storage capacity. However, that seems relevant only if one wants
to record/play samples of considerable length at high rates. If
it comes to playing NT modules, mass storage should be no
problem.
Therefore, it seems to me that it may be possible to play NT
modules in CD quality on a falcon if a NoiseTracker for the
Falcon using its hardware was available. Therefore, I'm very
interested in informations/speculations if such a beast will be
available sooner or later for the Falcon.
BTW, is there a tracker that makes use of the new sound
capabilities of the TT? I only got hold of a program called
"Jukebox", which had an option to play samples at high rates on a
TT, but it was not too impressive. Also, I'd be interested in a
tracker with some enhanced editing operations, e.g. simple
macros...

What!?!?! An....(gasp) Apple?!?!?!? Ugh, no way, I really do not
like Apple's desktop interface and I reallt do not like their
trackball. Or the IBM machines' either. Even if I got an IBM, then
I'd have to buy another incompatible word processor. Well, on
second thought, I have the original GEM Write around here...

No, I'm an original Atari man (since 1978) and I'm not about to get
another system. (yet- never say never)

Besides, the STBook last longer per charge, and cheaper per Mb than
the Apple, isn't it?

I guess one could get an IBM notebook, install the original GEM
(GEM 3 absolutely sucks!! Thanks for nothing, Apple!) interface,
and slap a few Atari logos (from B&C Comptervisions), and presto..
an ABC notebook! (Atari, are you listening??)

1730. Atari, Digital research, and GEM

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 19:04:33 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Aug18.190433.21767@sactoh0.sac.ca.us>
Source record: 218598

As stated in Atari's annual report, Atari has paid for, and has license in perpetuity, the rights to make an infinite number of copies of the GEM interface for the ST line of computers.

My question is do they have the rights to migrate the interface to another line of computers, namely the ABC line? Or any new line of computers that they may develop?

Although this is probably a dead issue, with OS/2 and Windows, I thought I'd ask.

As I mused in another post, one could get a notebook clone, install the original GEM interface, and a few Atari logos here and there, and you have machine that looks like the ST, with the exception of the operating system, of course.

1731. New operating systems (OS/2-TOS)

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 19:18:02 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Aug18.191802.22099@sactoh0.sac.ca.us>
Source record: 218599

If there is a grand future for Atari, I have a few comments on future operating systems.

Seeing that the basic GEM interface and TOS has been relative unchanged from the original 1985 version, and seeing the operating system for the IBM machines evolve to OS/2, what is in store for TOS?

I have seen what OS/2 can do, and compared to TOS, it seems to me that Atari is being left behind. Real multitasking through the OS, not through a program, drag and drop, being able to configure almost anything tthe user desires, and being a 32-bit operating system.

How does the current TT TOS (3.0??) compare? Is it a 32-bit operating system, or is it still tied to a 16-bit path?

What is the fastest Motorola processor?

What about the Motorola 88000? Is it faster, better, compatible?

Or will Atari start to make Intel machines? My feelings is why not. There is the ST market and the larger (in the US) IBM market. If Dell, Wang, and the others are making (??) money, Atari should be in there to capture some of the market. After all, Atari still makes the 2600 because there are people STILL buying them, so why not havev Atari expand their ABC systems to make the incremental sales.

1732. MiNT, shells

Newsgroup: comp.sys.atari.st
Date: 1992-08-18 19:57:51 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1107@usdtsg.DaytonOH.NCR.COM>
Source record: 218508

I have a question regarding MiNT and related things.

I finally set up MiNT 0.95 and have it call TC Shell. I've set up the paths and some variables, but have not quite figured out how to set up the termcap to be used (my guess is a TERMCAP variable or something?). I've tried to run STeVIe 3.4 but can not cursor anywhere but down, so I'm guessing the termcap may help.

Also, how do I access GEM from Mint, without EXITing the shell?

Since MiNT and the shells generally act like unix, is there some sort of unix documentation that may help me with things like background processes, etc?

Thanks...

L.A. is part of Atari heaven. You'll have no problem finding good dealers there. Just look in the phone book. I don't have any names or addresses off-hand though.

If you're going to be there around Sep 12-13, you should stop by the Glendale Atari Show. It's going to be excellent.

b> I am curios about the new board. The old one had 2 banks of
b>32-bit wide memory, up to 4MB per memory location. Will the new board
b>handle 4 banks (the easiest way to 64MB) or will it actually be able to
b>support 16MB chips (neccesitating the existance of only one bank)?

As far as i know (i think you're talking about the GE-Soft Mighty Mic TT-RAM expansion) they have 4 Banks on the new board (GE-Soft is just 500m away). But also the old 32 MB Boards should support the 16MB Chips so you can expand your memory up to 128 MB with an old 32MB board if you have 16 MBit chips at hand.

b>BTW, have they sorted out all of the incompatibilities they were
b>having with the older TTs?

I've heard from some users of the board that the newer ones (especially the 64MB board) works much better than the old ones. I have an old 32MB board with 16MB and never had any problems with it, and the new ones should be better (what's better than no problem?).

In article <1992Aug18.143241.5623@aston.ac.uk> wrighttj@uhura.aston.ac.uk (Auntie Tim) writes:

w>Firstly, what kind of speed increase do you get from the accelerator?
If you're thinking about a very cheap solution which just pumps up the 68000 to 16 MHz without any cache, the speed up will by just a little. You can get 10% or something like that. If you would buy a speeder board with cache (16kB), the performance will increase by 70%, depending on the application.

w>Is it worth coughing up more cash for a 25Mhz or even faster?
No, i don't think so. In this case i would think about a new computer (a TT oder the new Falcon030). In both cases you would have enhanced resolutions anyway.

w>Regarding Overscan, does it slow down the computer significantly when
w>it's running?
Because the screen memory is a bit larger it slows down the computer a bit, but not significantly.

w>There's also a hardware kit over here in the UK called the "Autoswitch
w>Overscan" which (I think) fits into the monitor (Hi res) and costs 50 UK
w>pounds-
AutoSwitch OverScan is an improved version of OverScan with much better software and a better hardware. It's built in the computer (not the monitor) and improves all resolutions. The developers are the same as for the original PD-Overscan so they know what they're doing. The autoswitch means that the software can switch from the enhanced overscan resolution (e.g. 708*480) back to 640*400 if the current software doesn't work fine with the higher resolution. And it switches back to the enhanced resolution after the program finishes.

w>Compatibility
I just can talk about the compatibility of AS-Overscan because i've never got an 16Mhz board. The compatibility is very high because you activate the Overscan resolutions in the auto folder and because of the autoswitch feature (see above). Games with autostart are no problem because without the overscan software you've got a normal ST.

bye, Dirk

In article <1992Aug15.043618.17054@news.csuohio.edu> max@madnick.cba.csuohio.edu (Max Polk) writes:
>Here it is in a nutshell: a parallel processing Atari microcomputer
>featuring a set of 68000 microprocessors, sold at low cost yet
>featuring high technology.

In 1985 or so, a company called Alliant Computer Systems based in Littleton, Massachusetts, introduced their FX series of machines, with the FX/8 being the main product, 8 68020-clones in a single chassis. This mini-supercomputer was outfitted with special vector-processor hardware as well, and cost around a million bucks. Alliant went bankrupt this year, and FX/8s now cost around $30K or so second-hand.

It's an interesting idea, but it takes hard work to get it right. Alliant abandoned the Motorola family in favor of the Intel i860, (which I think was a mistake) but their operating system was a pretty mature product already.
> * * *

>As I glanced at my JDR Microdevices catalog, I couldn't help but wonder
>why. Why is it that our thinking is so bound to a single microprocessor

>size having to make the single microprocessor do more and more things
>faster and faster?

Sure is. But still, it's very difficult to break up a problem into segments that can be run concurrently. If you can't partition your problem this way, then parallel multiprocessing doesn't gain you anything.
>
>The catalog I referred to lists the price of microprocessors you can
>order: the Atari ST's Motorola 68000 costs $6.95, while the 68020
>costs $189.95. The IBM PC's Intel 8086 costs $5.95 while the 80486
>that runs at 50 MHZ costs $1199.00.

Hm. The cost is certainly attractive, but I still wouldn't want to use anything less than a 68020 in a system I were to design today. A real 32 bit architecture, instead of the 16 bit data/24 bit addressing of the 68000, plus the support needed for virtual memory, exotic address spaces, etc. Just can't see developing a Real Computing System without it.
>
>Let's see: $189.95 / $6.95 is about 27, and $1199.00 / $5.95 is about

>exactly one process each, in parallel, than you could with one 68020
>running and switching between 27 processes, executing no more than one
>instruction at a time (for roughly the same amount of money)?

If you had 27 things you wanted to do right away, all at once, this would be fantastic. In my day to day use, I seldom have more than 4 windows open on my X terminal, and I'm generally only actively using one or two of them. When I ftp a new distribution of the X window system, or GCC, or some other large package, I actually do compile them in parallel on our FX/8 or FX/800, using up to processors at once on the 8. It's wonderful. But it's not a common occurrence. (See my paper "GNU & You, Building a Better World" in the proceedings of the 9th Annual Sun User Group conference...)
>
>For that matter, couldn't you do more with 201 good 8086's running
>exactly one process each, in parallel, than you could with one 80486
>running 201 processes all at once (for roughly the same amount of
>money)?

For roughly the same amount of money, you would have to scale back severely from 201 processors. It takes a tremendous amount of logic to synchronize a bus between a large number of processors.
>
>Consider what a great product Atari could have, flying into the twenty-
>first century at low cost, if they could write an operating system that

>totally protected, so as to achieve instances of deaf, blind, and mute
>minicomputers all inside the same box. (These computers inside of
>computers will be referred to as DBMT's: Deaf, Blind, and Mute aTari's.)

This is called asymmetric multi-processing. Sun is taking this approach in Solaris 1.x, and going for symmetric multiprocessing in Solaris 2.0. The Alliant Concentrix operating system was fully symmetric. It's just fine to have one processor per Unix process, but if you have only one kernel "process," then you get serious performance bottlenecks. 27 or 201 processors making system calls to a single OS process will be a major drag. You will find most of your processors waiting in spin loops for the OS processor to complete their service requests.
>
>The operating system would only wait for system calls to be issued from
>the various DBMT's and then handle the requests.
>
>Each DBMT would be constructed on a single plug-in board and there
>would be as many of them as you had slots to plug them into. (This is
>beginning to take on mainframe proportions!)

That's a good idea. I think Alliant painted themselves into a corner by only allowing a small fixed number of processors per system. (8 procs on an FX/80, up to 28 on an FX/2800.) Like the transputer approach, where there is no predetermined limit to the number of processors you can connect. But

again, the control circuitry for this approach gets quite complex.
>
>The process that desired to run a program would issue a system call,
>and could either wait or not for it to finish. The operating system

>and excellent protection (no more crashes either). Actually, the
>protection would be perfect, leaving no possibilities whatsoever for
>the user to tinker with system globals, keyboard vector interrupts,
>vertical blanking interrupt routines, etc.

So you're implying absolutely no sharing of memory between processor nodes, eh?
That means all communication between a node and the OS processor has to be by
DMA transfer? That will also introduce a performance hit. Motorola's DMA
controllers only operate at speeds of up to around 10 or 12 MHz, for transfer
rates of about 4 or 5 MB/sec. That's not so terrible for older SCSI-1 block
devices, but that imposes tremendous overhead for tty-style character-at-a-time
I/O processing.
>

>to get things rolling.

This is a very hard problem. To be able to easily split a single program
among different processors, you really want to have shared memory between
those processors, which is something we've already excluded from this design.
Aside from that, it takes a different mind-set to get out of writing programs
in the start -> crunch -> stop model of linear computing. Current compiler
technology just takes traditional code and tries to run loops in parallel.
If you have a huge processing job but it just consists of a sequence of steps
that run in series, you can't get any benefit. (What you do then, of course,
is fire off multiple instances of the job on multiple processors... But if
you only need to run it once, you can't win.)
>

It's an interesting idea. Sounds much like a transputer network, but with
no internodal communications.
>
>It's about time that someone tries this out in one form or another
>for reasonably-priced small computers, and Atari could pull it off.
>If they did, it wouldn't be perfect, since no new ventures like this
>are, but they could start things rolling and place their name in
>history.

Actually, thinking about this a bit more, there's no reason to limit such
a design to any specific model of processor. Ok, so we have a single bus
master that's basically a request dispatcher. When "the system" is booted,
this guy starts up, inits the I/O subsystems, and inits each processor
module. The processor modules and I/O modules can be pretty interchangeable,
basically a card that resides at a particular bus address, with a processor,
memory, and if an I/O module, whatever I/O channels it requires.

Hm. With a 68020 or up as the central system, you can have up to 256
24-bit (i.e. 68000) nodes. (Assuming that you decode the function codes & such,
giving a full 32 bit address space for the 68020 itself, and another 32 bits
for the nodes... Maybe even more if you care to distinguish I/O nodes from
processor nodes.)

Ok, now, in order to make each single node useful, they need to have a good
amount of RAM. I guess 4M is good for most common tasks. But wouldn't it be
silly to have, say, 16 nodes == 64M of RAM in your system, but you can't run
a single program that wants 8M because your memory is in 4M chunks? I guess
this tells me that you've really got to have a single memory pool, with
shared access to all the processors.

Ah, this brings up another issue. So I can buy 27 68000s for the cost of one
68020. I probably can't afford to outfit all 27 of 'em with enough RAM for them
all to do reasonable work, eh? I think it should be obvious from all this that,
when you're designing a computer system, deciding on the processor is one of
the easiest steps. Creating the memory system is the hard part, everything
depends on its performance.

[my suggestions for minimum hardware on a multi-proccessor system deleted]
>Sounds like the new Falcon to me.

Not even. For starters, it has an '030 - no "other cache" awareness,
and still maintains bus mastership like the other Moto chips <'040. Although
it does have a Processor direct slot, it sounds like it is only 16bits wide
which would really blow chunks trying to put another proccessor on it. It
is (so far) limited to 14MB - not much room for concurrent processes, let
alone system space. And to top it off - there is not much room to spare
in that 1040STe style case - multiprocessors+glue are going to be big and
are probably going to generate a LOT of heat, not to mention likely to
totally waste the power supply.

However, this is not going to stop it from being an excellent
single proc. machine - very multi-media-ish.

>directly wired from the old keyboard wires?

Remember, the Falcon has an internal IDE drive - that means they probably took out the internal SCSI connector. So you will have to get an external case, and a converter to go from 25->50 SCSI, and of course, the 25pin cable - you can get that at any Mac shop - in fact, just about any case/powersupply built for the mac should work perfectly. Also, if you plan to get a high-speed SCSI-2 drive in the future, I recommend you get the SCSI-2 rated cables - supposedly they give better performance (more s/n ??) but I have not seen this first hand.

Well, its not likely. It sounds (from the descriptions) that it's only
internal port will be the PDS. So until someone makes a graphics card to fit
the PDS, the answer is no (it definately won't have the VME slot).

>
>Also, does anyone know if there there is anyone presently developing sample
>editing programs that use the Falcon's sampling capabilities?
>

From the advert. noize, it is sounding like everyone and his cousin
is jumping up and down to get one so they can write software for it. Reality
is that the Music industry is the one jumping up and down - the rest, well
as a professor once said the proof is in the pudding (or in this case, the
software). It is almost a given that there are people working on software
that takes advantage of the new sound/DSP capabilities.

BTW, did you get a chance to try the dynamite demo on a TT?

Awesome. I hope they plan on making a .mod/.segm player - the
stuff they had sounded smoother/better than any other software I have tried -
I kept forgetting it was only 8-bit samples. Of course, they probably did some
optimizing of sounds for the demo, but...it still sounded good.

>Muchas Gracias

De nada.

I don't know what you mean by "serious limitation ... [of] mass storage capacity" - it has a SCSI-2 interface - not only bu**-kicking fast (upwards of 10MB/s - I'd _love_ to see a music-data-stream requiring a throughput greater than THAT!) but it can handle 7 of them. If you are referring to the limitations of the internal drive - now that is a different story. Yes, the internal IDE drive is limited to at most 2, and yes they are generally slower/smaller than SCSI drives. However, I was talking to friend who got a PC with local-bus IDE controller and she said it was faster than the SCSI-2 controller they tried...so I dunno - and yes, they were used on different (aproporiate) drives which were identical except for interface. _THAT_ is the only limitation I am aware of in the Falcon's mass-storage abilities.

> However, that seems relevant only if one wants

I would be VERY surprised if there weren't one out before the Falcons are out :). At least, it is supposed to be compatible with STE/TT sound so available-now NT players should work....

>BTW, is there a tracker that makes use of the new sound

Try NoizeTrakr, that should give you the editing capabilities you want. As far as a player, Backtrack is nice (but I thought that Jukebox (1.3?) was better). I am hoping that the guys who did the dynamite demo will do

a NT player. If you haven't see/heard it, you should give it a try. I just wish they would give you an "exit from demo" option. As far as listening, you should try NTcompiler-2 - it converts the NTs to segm, and to me it sounds better (it definately uses less CPU cycles to play).

A "windy" conference will be held this Thursday at 9:00 PM EST on
the Cleveland Free-Net.

Type 'go cafe' and it will be in the multi-user chat (channel '+AtariCon').

The last conference scheduled for Sunday was moved to Thursday
due to Free-Net system problems.

The conferenc will deal about a campaign to get some FANTASTIC software
for the ST and Falcon. If interested, please join!

Don't forget to wear your jacket though, it may get windy... :)

>Is it better/worse than the PD overscan hardware mod?

It doesn't slow down the ST significantly.

I highly recommend AutoSwitch-Overscan to every ST user!
Reasons:

-It's easy to build in (some soldering).
-With a regular SM124 you have up to 736*480 dots on the screen
-You can define a list of (dirty, dirty!!) programs, which are not capable of running in others than the original ST-resolutions. If you start one of 'em, AutoSwitch Overscan will switch to the 'normal' rez and gives you full compatibility.
-The software of the PD Overscan is buggy and won't be upgraded anymore. - On the other hand, the software of AutoSwitch-Overscan is updated regularly so that you won't get into trouble with new versions of TOS.

Regards
Patrick

1747. MiNT disk formatter

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 01:38:06 UTC
From: azog@world.std.com
Message-ID: <Bt7J7K.GFu@world.std.com>
Source record: 218507

Is there exist a MiNT capable floppy disk formatter (ie: one that can
be run as a bg process)

In my travels thru ftp, I havent seen one, but am sure one must exist,
as its such a wonderful idea.

If not, I would like to write my own. I assume that the code is resident
in GEM and/or TOS, and would like to know how to call it. My ideal
would be something like:

$ mkfs -density filesys

Where -density would be single or double sided, and high density for
those lucky enough to have it, and filesys would be a floppy disk
designator.

Thanx

Yes, but the IDE drive is optional. I think it will be possible to
connect the SCSI ribbon cable internally to the external SCSI port; i.e.,
soldering the individual wires to the leads on the inside of the connector...

>>The other thing is if I were to get a Falcon (whether or not I put the

Oh, I see you're right from my trusty Atari Advantage! :) Didn't notice
that. But it doesn't do TT High (1280x960 monochrome) though...

And I wonder if MultiTos will run ST high res programs in windows in its
640x480 65k color mode?

adrian@robots.ox.ac.uk (Adrian Cox) writes:

>What I have not heard of is
>a parallel architecture good for interactive programs such as word
>processors and art packages.

While "performance" is a moot point for straight wordprocessors, art packages and DTP programs could achieve significant benefits from vectorization. The bezier curve algorithm is trivially vectorizable, for example, and probably consumes the greatest amount of CPU time in DTP packages (when coupled to drawing font elements, etc).

However, any multitasking environment will benefit from multi-processing, and this was the original poster point, I believe (since only a two-processor system was referred to - useless for vectorization).

>I don't know about me, for the moment I have very little money. Maybe
>it will be spring before I have saved enough (that doesn't mean I'll
>buy the Amiga).

I'm a die-hard Atari fan, but even if I had the money, I wouldn't buy a Falcon right away. Let's take a look at the last two computers Atari released, the STe and the TT. The STe is now starting to have some software written specifically for it, but many software houses just don't bother, in the interest of staying ST-compatible with their new releases. Now, the TT has very little machine-specific software available, and considering the non-impact that the TT has had on the market, I would not expect too much more. In fact, if the Falcon is sucessful it may end up killing the TT completely.

So, I just want to see how the Falcon will do before I consider buying one. Not to mention that I'd rather wait until all the initial-release bugs are ironed out!

1751. Slow hard disk with Spectre GCR :(

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 04:27:55 UTC
From: dtarico@violet.ccit.arizona.edu
Message-ID: <1992Aug18.212755.1@violet.ccit.arizona.edu>
Source record: 218524
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have recently set up a Spectre GCR on my system which consists of Mega 4 ST, ICD AdSCSI host, Maxtor LXT-200 disk drive. Also, I have Spectre v. 3.0, with a 50 meg partition formatted for Mac. The hard disk writes seem to be slower than they should be. It works ok, and reads seem sufficiently fast, but writes of large files seem slow.
For example, copying Superpaint 2.1 from a Mac floppy to the hard drive on my system took 1 minute 14 seconds. The same operation on a real Mac SE/30 took only about 23 seconds. On my system, during the write to the hard disk, it would pause so long that the light on the floppy would actually go out while it was waiting for a part of the HD write to finish.
Is this normal, and if so, why?? Thanks!

Mark Newton-John writes:

>I guess one could get an IBM notebook, install the original GEM

That's the operative sentence...

One CAN get an IBM compatible notebook computer, OR a
Mac Powerbook... now.. and compute real computing on it.

OR.. one could wait for the STBook... and think about how
great it will be to compute on it.. someday.

It all depends on whether you need a notebook computer NOW, or
if you're satisfied knowing that someone, somewhere in Europe
has one... and you don't.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <64270@cup.portal.com>
Source record: 218513

Tim Wright asked some questions about Dungeon Master...

According to FTL, the person carrying the rabbit's foot will be
"luckier in some circumstances"... as far as I've observed, it's
real purpose in life is to take up a valuable slot in your backpack,
and to be used to hold floorswitches down.

The jewelery is tough to pin down.. a few are obvious in their effects.
The Moonstone adds 3 mana to the Champion who wears it.
The Illumulet gives a low level of illumination in the Dungeon at all times.
The Pendant Feral adds one to a Champion's Wizard level.
The umm.. gak.. it's either the Ekhard Cross or the Jewel Symal..
makes the Champion regenerate health points quicker...

Most of them don't have enough effect to make any real difference though.

(Oh.. and the Choker maked the Champion use food more slowly)

The only advantage to wearing the Armor of Darc and Lyte is better
protection, IF your Champions are strong enough to carry it. My ladies
were never that strong, and so left it behind, preferring to rely on
quick reflexes rather than thick armor.

In my experience, the only time a weapon really affected a particular
monster more was the Vorpal Sword, which was the only weapon which could
hit a "non-material" being.. the damage from all weapons seemed to be
based on a random roll, modified by the maximum damage of the weapon.

Here's a "fun FYI".. did you ever put a coin in your Champion's
"action hand" and click on it like it was a weapon..?

Rasmus Petau asked about a locked door on Level 15 (actually, the way FTL
itself numbers the Levels, the Hall of Champions is Level 1, so there
are only 14 Levels.. so I'm assuming the question is about the
Dragon's lair..?)

The only locked door I know about on the Dragon's level is the one
which leads to the Power Gem... which you HAVE to get in order to
complete the game. The other door on the level is opened by inserting
a coin in the slot next to it, and leads to an altar of resurrection
(just in case any of your Champions gets toasted by the Dragon).

(The key to the door in front of the Power Gem is hidden under one
of the piles of ashes on the floor, by the way...)

You're right, Tim.. DM *is* a classic...!

1754. How Do I Restore My Hard Disk FATs? (Help!)

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 05:44:03 UTC
From: bmaraldo@watserv1.uwaterloo.ca
Message-ID: <Bt7uLH.JIE@watserv1.uwaterloo.ca>
Source record: 218515

This evening I discovered that there was a problem with one of
my hard disk partition folders. Specifically, my utilities folder had
become corrupt. I could not drag the folder into the trash can for
successful deletion. Instead I did a 'copy' under TOS 1.4 to my TMP
dir on the same partition. It copied successfully. So, I deleted the
folder out of the TMP dir. I rebuilt the dir from backups. Then I rebooted.
When the system came up, the contents of my E:\ partition was
showing up in my D:\ partition (the one with original problem) and the E:\
partition was no where to be found. The C:\ (boot) partition was fine.
The I used ICD's 'rebuild partition' utility in the ICDFMT program. Now,
both the D:\ and E:\ partition's register as existing and empty. When I
look at sector info with Disk Doctor, I see that all the original files
are on the disk (ie. it wasn't wiped). This represents about 2600 files
and no user files backed-up.
THE QUESTION: How do I restore the FAT in the partitions so that the
dir points to all the files? Is there program I can get to do this? I
have no programming experience. Am I completely f*ucked??
Any help would be appreciated... I'd hate to have to reformat.

> "I scan what I scan, and what I scan needs no excuses."

CrackArt (v 1.0) can be obtained at atari.archive.umich.edu, in the
atari/graphics directory. The package contains german docs.
The docs have been translated in english but i can't remember
anymore where one can get it...

If you send the shareware fee (DM20 = ~ US$13), you'll get the new
version (v 1.20): that's what I did, and I've got it yesterday...

From what the authors told me, they're currently developping "scanner drivers"
for C.A., and gave end of August as a release date.

Bye.

>principal concern of mine.

Same here. You can't seriously multitask (and that's the way Atari
seems to be going) with such a small screen. We want many windows open
at once, so there has to be room for them on screen. Anyway, I think I
remember reading somewhere that a programmable overscan will be built
in, and that the Falcon could easily (and cheaply) be upgraded to about
900x1200. That sounds more like it, huh? Problem Is, monitors above 768x1024
rapidly become unaffordable (at least color monitors do). BTW, if I
remember correctly, it was someone from Atari who said it. Makes it
less of a rumour. It sounds believable anyway, since OverScan does
quite good work in an ST for little dinero. Shouldn't be too hard to
integrate some kind of overscan in the video circuitry.

[stuff deleted about which I know nothing anyway]

> 16 Aug 92 11:31:54 register p; {

What's that ? There's no such Info-Text in the uucico-code. Send me a list
of your exactly system-configuration and Environments.

> Maybe nn only works under MiNT. Have to go looking for MiNT traps, I
>guess.

No, the nn has been ported with TC. I didn't know who ported it but the one
was using the mupfel. That's the reason why there is a file
$HOME/nn/param.mup (the extension mup is for shellscripts under the mupfel).

If you wants to use the nn under MiNT you will need a little programm that
helps you because the nn is compiled with TC and uses the _shell_p-vector
to give commands to the shell. I didn't know any shell under MiNT that will
set this vector. So you will have to set this vector and write a little
function beeing executed when a programm uses _shell_p.

If you don't have such a little programm you can only read news. You will
have no chance to send a followup or reply. That it is working with a little
help you can see on my system. I only read mail and news under MiNT.

The nn also makes trouble under TOS when you are using gulam. I didn't know
why but the arguments won't pass correct to gulam.

Nice reply from someone- I tried to post a followup and was politely informed that it would be redirected to comp.sys.amiga.advocacy. Why do people do this? I don't go over to their groups and shout at them; I guess it must just be insecurity... :)

Anyway. I don't know whether the original article was posted direct or copied from somewhere, but it was nice to have all the recent speculation confirmed. Especially the CD quality sample recording stuff... Maybe the Amiga freak would like to cross over to rec.music.makers and rec.music .synth and tell them that they've been wasting their money on the Yam DM80, Alesis ADAT, Plasmec ADAS et al and that they could have bought an Amiga instead. I'm sure they'll be convinced...

Okay, bitching about it won't solve anything... Time to modify the KillFile, I guess...

Autoroute is a very capable program and became very popular in PC arena.
The ST version I saw was an early version and if I am not mistaken has
not been updated. The PC version grew stronger and now supports some
European countries as well.

1769. Bob Brodie comments at the Connecticut Atarifest

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 18:06:54 UTC
From: peters@allvax.enet.dec.com
Message-ID: <9208191806.AA20817@enet-gw.pa.dec.com>
Source record: 218530

Some people have already commented on what Bob Brodie said at the Connecticut Atarifest that took place last weekend. I've just reviewed the notes I took while he spoke and hopefully I can pass along some new information.

- the RAM board holds a max of 14 Megabytes, and is not proprietary in its design. Atari used a board since they could squeeze more memory on the Falcon than if they had just used SIMMS.

- There is supposed to be a 1 Meg machine available. But, since the operating system takes 2 Meg, I asked how a 1 Meg machine was possible. He didn't know the technical details on this.

- Developer DSP documentation is shipping "this Thursday"

- Atari hopes to avoid the 3 month long lead time for FCC certification by going thru an independent lab. One of their people has said that the Falcon030 "should" pass without any problem, and this is why they expect to have machines for the USA by mid to late October.

- 32Mhz operation is not possible, according to Atari. But Brodie did say that other developers (e.g., Jim Allen) have surprised them and made the hardware perform faster...

- The SC1224 will be able to handle 16 bit "true color"

- He gave a hint that later machines might have a 68040 processor.

- The mouse port is still under the case, as in the 1040 series.

- Marketing info and price will be announced at the Duesseldorf fair.

- 75 Falcons are now in the hands of developers.

- Mac-formatted sound files can be used (they did this with a disk of Star-Trek sounds, associating the "transporter" sound with the opening of a window!)

- As to a question as to what would be the new bottom line computer after the Falcon was released: "No comment".

- If anyone wants more technical info on the Falcon030, contact Bill Rehbock at Atari (Voice: 408-745-2082, Fax: 408-745-2083).

On other matters:

- Atari's new policy is to use Bitstream fonts.

- The ST Book is being redesigned for more memory and a new screen, and should be out the first quarter of 93.

- The GE service deal is still getting going.

>or Connect?)

It seems somewhat odd that Modem 2 and up support the high baud rates,
but not Modem 1. I wonder if Atari was trying to keep some compatibility
with the old machines that I do not fathom? (i.e. shouldn't Modem 1 and
Modem 2 act the same way?). I've done transfers of 38,400 baud from my
MegaSTe to my PC using Connect 1.8i (I would have gone higher, but the baud
rates listed above 38400 for the PC and ST term programs didn't match).

I wonder what kind of speeds the Falcon's DSP could do if it were
programmed for such purposes...

Yukkk!!!!! Get that soldering iron away from my war-on-teed machine!
Better off just paying for another $50-100 than to not only void your warranty,
to then threaten the life and longevity of your wonderful new machine by such
a Nasssty hack.

Maybe after the Falcon has been out a few years, and only costs <=$300
would I even consider that sort of approach.

>directly wired from the old keyboard wires?
>

Well, I hate to rain on anyone's parade, but in the release specs,
there's mention of a new keyboard chip, so hooking up an old ST or TT
keyboard is probably not an option. As they used the 1040 case, though,
it might be possible to fit the new keyboard in a mega keyboard case,
and fake up a new cable.
I had the same thoughts when I heard the Falcon came in a 1040 case.
After you have a printer, monitor, and any other assorted cables sticking
out of the back of the case, it's a b*tch moving the computer around.
Besides, I'm gettinb real used to typing with the keyboard in my lap.
Atari hasn't said what new keyboard chip they're using, maybe it'll
be the same on as in a clone keyboard. Probably not, though.

>would be equally functional for me, so does anyone have experience of this?
>Is it better/worse than the PD overscan hardware mod?

I think that Autoswitch Overscan (or simple AOS) is much better than PD version
(which is called Hyperscreen if I remember correctly). When encountering a
"dirty" programm (those who only work in 640x400, mostly GFA-Basic programs)
while using Hyperscreen, you'll have to switch off your computer, turn that
switch and restart. With AOS, all you have to do is quit the programm, and
restart it again while pressing a hotkey (ALT-CTRL) and AOS will switch back
to standard resolution. If you think you've got to use that dirty program
for a longer time, just add it's name to AOS' inf-file and AOS will switch
back every time you start it. After finishing the program, AOS will switch
back to the extended resolution.

Additionally, Hyperscreen is no longer supported by it's author, AOS is. When
comparing the two programs, you'll also find that AOS has a very powerful
setup program allowing you to get the last pixel from your monitor.

>Compatibility- I play a few games in colour, but presumably both these mods
>can be deactivated so that shouldn't be a problem (should it?) but in hi res

>experience of how these programs work with 16MHz / Overscan modes?
Most games won't work with overscan or 16 MHz, but that's no problem. AOS
needs its software to work, if you boot from disk to play, it won't be
activated so you'll have no problems...

>>still be suck when compared to much more featureful OSes such as

This is absolutely incorrect! I've seen it in action, I even got to test it out to a certain extent, and it is *wonderful*! I'm so impressed I'm actually speachless. We're talking Amiga-level multitasking here guys, with the sole exception of floppy-disk access (stops everything else on the ST, while the Amiga will keep on chugging along). I saw it in action on a Mega-4 with AdSpeed, and it was *FAST*, three copies of a line-drawing program were up (in high-rez color on a graphics board of some type), a program was loading a GIF in the background, a clock was functioning (the hands were moving correctly), a TOS program was checking-off the percentage of cpu time each program was using, text was being entered into a text editor all at the SAME TIME! AND, during this, it was decided to *really* stress the system out, so about 20 megs in files were grabbed and copied from one partition to another, no *that* slowed things down a bit, but everything still worked, and the file copying just took place in the background! (this did not work when tried with a floppy disk...)

I was not expecting anything even *remotely* as professional and excellent as this. Prepared to be very *happy* if this ever actually gets produced.

Well, I would like the US version of such a program if it exists. I imag-
ine such a program would be easier to write for England, since it has fewer
miles of road per car than any other country. Anyhow, if something like this
is out there for Atari, someone please let me know!

< >principal concern of mine.
<
< Well, its not likely. It sounds (from the descriptions) that it's only
< internal port will be the PDS. So until someone makes a graphics card to fit
< the PDS, the answer is no (it definately won't have the VME slot).

Yep, the provisions for video upgrades on the Falcon don't look so great,
Yet Another Proprietary Interface (YAPI), the PDS. Also in Tramiel's
announcement on Genie, he said explicitly that the 640x480 mode, at least
with 16-bit colour (which is a great feature, mind you), is **INTERLACED**!
Sigh. This means some good things, as he mentioned, like the Falcon will
work on SC1224 monitors (as well as VGA monitors with higher scan rate).
But it also means that the Falcon will have the same interlace problems
that the Amiga 640x400 16-colour mode has - FLICKER. Not too bad on
digitized images, but for the desktop or window/text displays, it will
drive you crazy.

Does anyone have any more detailed information on this? Will all the
640x480 modes be interlaced? Will both the SC1224 and VGA monitors work
in all modes, or just some of them? Which ones?

Speaking of FSMGDOS, I got the lastest version of it a couple of weeks ago with my Wordflair II upgrade. It's supposed to be MultiTOS friendly, now, but I can't get it to work! Whenever I run Wordflair, I get 4 bombs (grrr), so I went back to the older version I got from them with the last upgrade.

A side note about FSM's `vapourware' status: The README file that came with the upgrade mentioned that FSM is still in the testing stages, with an official release yet to come (I guess that makes me a beta-tester :-)).

1779. GNU and UW

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 20:32:33 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1109@usdtsg.DaytonOH.NCR.COM>
Source record: 218550

I have a question regarding UW (Unix Windows). When I compiled the server sources on our unix box at school, it compiled fine. But when I try to compile it on another unix box, it mentions a number of files that are not on this unix box (.h files).

What I want to know is if I can compile it on another system, and use the executable on this unix box? I could either have a friend compile it for me on the school's unix box, or if I ever get GCC set up (under TC Shell/MiNT), maybe I could compile it there.

The main question is if I *can* cross-compile it on either my Atari or on the other unix box, what flags/settings/variables would I need to set up in the makefile? The destination box is a 68020-based system. Also, what would be the setup to make it work on a 386/486 system running System V? Any help would be appreciated. Thanks...

1780. Article on FALCON in German mag c't

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 20:45:30 UTC
From: kruel@wpcst1.phys-chemie.uni-wuerzburg.dbp.de
Message-ID: <H.rYMcKrPZhMM@wpcst1.phys-chemie.uni-wuerzburg.dbp.de>
Source record: 218532

I wonder that this has not been posted yet:

The German computer magazine "c't" (one of the leading ones) has an
article in its September issue on the Falcon030, which will be presented
definitely on the Atari fair, Aug. 21-23, 1992 in Duesseldorf/Germany.

Even though some of the information has been posted before, I'll post
the summary again for some details (may be):

- processor 68030/16 Mhz
- coprocessor 68881/68882 optional (socket available)
- RAM: 1, 4, or 14 MByte
- ROM: 512 kByte (internal), 128 kByte (external, ROM-Port), 16 bit wide

Sound subsystem:
- DSP 56001/32 Mhz with 96k SRAM (0 wait, 32 kWords at 24 bit)
- 16 bit stereo AD/DA
- sampling rate max. 62.5 kHz, external clock input available
- 8 bit sound compatible to STE
- 3 channel PSG sound compatible to ST

Video subsystem:
- ST low 320 x 200, 16 colors from 4096
- ST med 640 x 200, 8 colors from 4096
- ST high 640 x 400, 2 colors from 4096
- 640 x 480, 256 colors from 262144
true color mode:
- 320 x 200, 32768 colors
- 320 x 480, 32768 colors
either overscan or interlaced mode, may be sychronized from outside
overlay mode, HF modulator
- Blitter at 16 bit, 16 MHz

Interfaces:
- DSP connector, Sub-D, 26pol. fem.
- SCSI-2, 50pol.
- Centronics, Sub-D, 25pol. fem.
- RS-232, Sub-D, 9pol., male
- MIDI In, Out/Thru, 5pol. DIN, fem.
- LAN, compatible to TT030 and STE (8pol. Mini-DIN, fem.)
- ROM-Port (cartrigde, 16 bit, compatible to ST)
- 2 STE compatible joystick ports, Sub-D, 15pol., 3 rows

Storage subsystem:
- Floppy 1.44 MByte, 3.5''
- HD, internal IDE Bus, external SCSI Bus (size expected to be

40 MByte), 2.5'' within the case

Miscellaneous:
- operating system unclear; currently TOS 2.07, MultiTOS to be expected
- real time clock, battery backed
- internal expansion port
- fan
- connectors for microphone and speaker
- case like 1040

Price: around DM 1500 (~ UK L 500, ~ FF 5000).

In particular, it might be interesting that ordinary MultiSync or VGA monitors can be connected now instead of just a SM 124.

The machine presented to "c't" had no MultiTOS yet, but a modified TOS 2.07 (whatever this may be). "tms" claims that they were able to port their program "Cranach" easily to the new system. QuickIndex reveals a CPU performance of about 50% of the TT030. It's quite unclear to me what the LAN interface is meant to be.

There is a photograph inside the mag which shows a rather clean board apparently ready for production. The machine presented here was handed out to the magazine in the beginning of July.

The machine seems to aim at the consumers market, rather at the low than the high end. Alwin Stumpf from Atari Germany did not exclude that yet another machine may be released this year, but left it open if that will be a Falcon040 or an even smaller system.

I'm personally quite unsecure if I should replace my old MegaST by such a machine. I think it's better to wait for a high end machine such as the speculated Falcon040. There is still a need for MultiTOS to become ready, before.

Regards,
Thomas

Along with Straight FAX from Joppa Software Development... there is a program called FastFax from Michtron (or whoever they may be now.). I also read in a magazine at one point of another company comming out with a background fax program. Dunno...

I thought you would get the TC mode at 640x480...guess not.

> - Blitter at 16 bit, 16 MHz
> Interfaces:
> - DSP connector, Sub-D, 26pol. fem.

What is a Sub-D, _26_? Is this a 26pin variant of the db25/db9 that
is the standard for RS232C? If so, how will you know if it is upside down?

[specs deleted]

> Miscellaneous:
> - operating system unclear; currently TOS 2.07, MultiTOS to be expected

_2.07_????? I would think it would be a 3.XX variant since it has an '030
in it. Why are they using a 2.XX???? Granted, it will (supposedly) come
out with Multitos, but ... that is still confusing....

> - real time clock, battery backed
> - internal expansion port
> - fan
> - connectors for microphone and speaker

These are normal micro-jacks: the same kind as most earphones/portable
radios (like walkmans) have. Very convienient - I wish the TT used these, so
that I wouldn't have to use the cheesy RCA-jack to micro-jack converter I use
now for my amplified speakers.

> - case like 1040
>
> Price: around DM 1500 (~ UK L 500, ~ FF 5000).

Well, according to Security Pac. Bank, the exchange rate today is
1.504 (or thereabouts) so that would make a US model about $1000. Not bad,
but could be better - lets hope so.

>

Pardon my ignorance, but what is Cranach?

> QuickIndex reveals a CPU
>performance of about 50% of the TT030.

That is dissapointing. I was hoping to get around 60% since it
wouldn't have to deal with as many memory wait-states as the TT does. BTW,
is this rating comparison with the TT from Qindex running in Slow or Fast
memory? Since the Falcon's RAM is (likely) to be designed similarly to TT
slow memory (Video/CPU time slices, etc.), I guess a 50% speed is to be
expected.

>It's quite unclear to me what the LAN
>interface is meant to be.

This is a Lan connector that is identical to the mac localtalk
connector. They just need to implement software that uses it (for use in a
local talk network - they already have Atari-specific network software).

> I'm personally quite unsecure if I should replace my old MegaST by such
>a machine. I think it's better to wait for a high end machine such as the
>speculated Falcon040. There is still a need for MultiTOS to become ready,
>before.

I don't know. If you can put up with the built in keyboard, then
I would say go for it. It is more than a replacement for the MegaST(E).
What I want to know is, can it use the previous color/mono monitors that you
are using with the MegaST (probably not), and if so, what are the max
resolutions with the SC1224?

[stuff deleted]

Sorry to tell you this, but overscan doesn't work that way. According
to the post from the interview with Sam T., the overscan will give you around
732x400 (I believe - I deleted the article) with overscan in the 640x400 mode.
Overscan just makes the left/right boarders disappear - basically it starts
early/delays the Hblank signal so that you get more pixels/scan line (horiz.
line on monitor). It does not change the basic output frequency which is the
big factor in determining screen Resolution (1024x768 needs a higher display
signal frequency than a 640x400 - the 640x400 is just a "safe" size for the
frequency of the signal, with margins for error (the borders) to keep from
accidentally displaying over the rest of the screen, and to give the monitor
time to "hide" its video gun as it aims it from one side of the screen to the
other to get to the next scan line). So, unless you get a video card that
is able to output a higher frequency for the larger screens, 732x400 is gonna
be your max size.

>along with any GDOS files.

I don't know exactly what fax software usually does, but I thought I should mention that ghostscript comes with source for a couple of fax drivers (but they aren't compiled into the ST version of GS). I don't know if the output format would work with your particular modem, but it should be fairly easy to write new drivers that do, assuming you know what format you need. These GS fax drivers just convert a PostScript file into a bitmap that the fax modem can understand, so presumably you still need something to send the bitmap to the faxmodem. If all that is required is sending the file to the serial port, well that is no problem, and GS can even do that. Since GS is free, this might be a cheap way to test your modem. Someone please tell me if I am oversimplifying this.

Of course, GS can't help on the receiving end, so it you want to send AND receive ....

1786. Atari Equipment for Sale. . .

Newsgroup: comp.sys.atari.st
Date: 1992-08-19 22:24:01 UTC
From: jasond@microsoft.com
Message-ID: <1992Aug19.222401.29365@microsoft.com>
Source record: 218538
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

Greetings,

I have decided to part-out my atari equipment.
The following is a list of hardware; everything can, of course,
be purchased as a system.

Secondary Storage

Atari Megafile 44 (44Mb removable cartridge hard drive, Syquest mech, SCSI)
Seagate ST296N (85Mb 5 1/4" HH, SCSI)
Under Monitor case with 2 bays, power supply, ICD ADSCSI+ Adapter, fan, cables.

*Note, the Megafile comes in a case w/ power supply and adapter of it's own.

Monitor

Atari SC1224 Color Monitor (No display problems)

CPU

Atari 1040ST with 4Mb RAM (Zubair ZRAM 3D card, might separate.)

Accessories

Monitor Master
Extra Mouse

ALL OF THE ABOVE EQUIPMENT CAN BE HAD FOR $1200.
IF YOU WANT PIECES, EMAIL ME WITH OFFERS.

jasond@microsoft.com

PS. I also have a TT030/8 if anyone is interested in purchasing it.

>Thanks in a dvance ! :)

Sure, Their fax number is (717) 428-0424. Also, I received e-mail informing me
that there is also a program called QFax Pro which is supposed to be able to
do background operations. I didn't get any more info on this program but I
will post it when I do.

> a) don't know that they don't own the bus,
Which is definitely wrong!
Even for the simple 68000!
What do you think are the pins ~BR(bus request),
~BG (bus grant) and ~BGACK (bus grant acknowlege) for?

> b) don't understand any kind of memory but super/user,
They understand:
supervisor program
supervisor data
user program
user data
That can enhance the 16 MB limit (see below) to 64 MB,
but what does that do WRONG????

> c) only have 24bits address line
Which means 16 MegaByte and should be enough on a multiprocessor system
where you have, say 8 MB private an 8 MB shared RAM for each processor.
That's 27 * 8(private) + 8(shared) = 224 MB main memory. Not enough?
Boy, your last name is croesus isn't it?

> 2) Related to the last point of 1), you really want to have a distributed
> multiprocessor-system - how many times do you run 27 applications simul-
> taneously?
Why? you can split ONE application into several THREADS!

> Not to mention that each processor would have to have its own
> memory - and it doesn't sound too appealing or marketable to have to buy
> 27MB so you can have 27 1-MB virtual machines.
Make it upgradeble at least one and at most (as much as you want).
1MB is much for that task.
Even 8MB (shared) main memory and 128KB (private) cache may be enough
with a hardware supporting virtual memory.

> [...] a distributed multiprocessor system, you distribute tasks over the multiple
> would still be going at the original (single processor) speed.

There you address the one and only problem: THE SOFTWARE!
You need a distributed environment!
A parallel OS and parallel Applications which means
parallelising (? ;-) developement tools.

THAT'S THE REAL PROBLEM AT ALL!

At least with ATARI! ;-)

I tried to run Elvis (the version I have is 1.3) on my TT, and I get some error message that is displayed (and then the program exits to the desktop) so fast that I can't really read it. From what I was able to make out, it sounds like it is complaining about something in its environment. I see that there's an ELVIS.RC file in the directory (I unpacked into a separate ELVIS directory) - is there something I need to change in that file to make Elvis work on my TT? (I currently have 2MB of ST RAM [:-(my 2MB ST RAM expansion board went bad, screwing up the video, and my dealer is waiting on a replacement], and 4 MB of TT RAM.)

STeVIe works fine (I miss some of the ex [':'] commands etc. that were not ported from vi though) on my TT.

Please reply by email if possible. (I'd be happy to summarize responses in a later posting!)

We shall see when the price is released for this board...

Will Atari screw us or will they pay us back for our loyalty?

The truth is now!

>
> - There is supposed to be a 1 Meg machine available. But, since the
> operating system takes 2 Meg, I asked how a 1 Meg machine was
> possible. He didn't know the technical details on this.
>

I'm sure anyone who read the Atari Advantage article had the same question,
why is it that Bob Brodie didn't find the answer?

> - Developer DSP documentation is shipping "this Thursday"
>

I'm surprised it was shipping two months ago.

> - Atari hopes to avoid the 3 month long lead time for FCC certification
> by going thru an independent lab. One of their people has said that
> the Falcon030 "should" pass without any problem, and this is why they
> expect to have machines for the USA by mid to late October.

They shouldn't announce a release date unless they are SURE that it
will be released at that time. I'm surprised that Atari didn't learn
its lesson with about 80% of its products.

>
> - 32Mhz operation is not possible, according to Atari. But Brodie did
> say that other developers (e.g., Jim Allen) have surprised them and
> made the hardware perform faster...

I have no problem with 16 MHz as long as it is quick.

>
> - The SC1224 will be able to handle 16 bit "true color"
>
> - He gave a hint that later machines might have a 68040 processor.
>

Oh, I think this is obvious. What I want to know is will these
machines be at least 32 MHz? Will they have greater resolutions?
Will they have a great case? Will they be expandable?

> - The mouse port is still under the case, as in the 1040 series.
>

Yes, I guess we knew that the BIGGEST gripe among Atari users would
not get fixed. WAY TO GO ATARI! You sure listen to your users...

I've learned never to do things half-assed in this world. If you are
planning to do something, do it right or don't do it.

> - Marketing info and price will be announced at the Duesseldorf fair.
>
> - 75 Falcons are now in the hands of developers.

About two months ago, I heard that there were 500 HUNDRED sent to
developers.

If there are only 75 in the hands of developers, forget a large
number of title for at least six months.

>
>
> - As to a question as to what would be the new bottom line computer
> after the Falcon was released: "No comment".

NOW, this is VERY VERY VERY dumb!!! I hope Atari isn't planning an
A600 because if they are, I'll go IBM compatible. I swear.
They should make the Falcon 030 the bottom line computer and everything
up from there.

Unless of course they are talking JAGUAR.

ahahahhah! Unix users have been multi-tasking with no troubles at
all, just using DUMB TERMINALS. You can always use multiple-screen
interfaces (eg. "miwm" for MiNT, which even though it is a quick-hack,
is still excellent; or for those keen - just port Unix "screens").

Multiple windows is not a pre-requisit for multip-tasking... though I
imagine BigScreens will appear for the Falcon even faster than they did
for the ST...

But are you really going to plug a $1500 monitor into your $1000 computer :-)?

>work on SC1224 monitors (as well as VGA monitors with higher scan rate).

BEEP. The SC1224 simply cannot handle such high resolutions - it doesn't
HAVE 480 scanlines to use! The VGA/MultiSync monitors will not experience
the flicker - just as they don't on the Amiga.

Me, I'm impressed that they even BOTHERED to support high-res on the SC1224.
You'd be a bit crazy to buy an SC1224 rather than a MultiSync, considering
the slight cost diff, compared to the value you will get out of the Falcon's
higher resolutions. The Aint No Such Thing As A Free Lunch, and your SC1224
will never handle 640x480 non-interlaced.

Question: will 1280x480 interlaced be possible with a MultiSync?

NOT 400. *480*. So 732x480 will be the max size - that's 37% more desk
space than in ST High. TT TosWin users can tell you what 640x480 colour
windows are like to use...

I just finished "pruning" my hard drive (getting rid of unneccessary files, etc) in preparation for backing it up [Very necessary, the last time I backed it up was LAST September.. youch...]. What I need is a program that will reliably backup my hard drive and not require me to jump through hoops to do so....

I've been using Turtle for years but today is the first time I tried it on my Mega STe..... and it didn't work.

What I need is some sort of backup utility that will allow me to use both floppy drives in a manner similar to Turtle.... and it would be nice to have one that also restores files (I plan on reformatting my drive as soon as I backup all my partitions (including the minix ones..) and don't want to go thru the hassle of having to worry about what file belongs in what directory.... (Does anybody have a cpdir like the one for minix ?)

Oh yeah.... I'd appreciate the Internet address for any location.... I can't get to it right now (Our Internet link is screwed-up, the only thing going in or out is Netnews.....)

Please reply in this group. WHile I will EVENTUALLY get any mail sent to me it looks like it'll sit downstream from here for a week before I get it...)

Thanx
-Andy-

ps. I've heard of "The Vault" but it's not on a.a & I can't find it elsewhere...

1798. Falcon question: is 640x480x8 mode memory-mapped?

Newsgroup: comp.sys.atari.st
Date: 1992-08-20 03:37:16 UTC
From: warwick@cs.uq.oz.au
Message-ID: <9897@uqcspe.cs.uq.oz.au>
Source record: 218548

VGA is known to be as slow as a dog for certain applications - because
the memory for the graphics resides on the VGA board, and accessed through
a slow architecture, the details of which I am not familiar with.

BUT, will the 640x480x8 mode (256 colour) of the Falcon suffer from this
(I doubt it), or is it memory mapped and consistent with the other graphics
modes, ie. interleaved bitplanes.

I am particularly interested in this, since if it is similar to the normal
ST and TT modes, all my local software can trivially port to it, and I
will not miss the TT-low and TT-medium modes I see on friends' TTs (since
they are both subsets: 320x480x8 and 640x480x4).

Anyone know yet? And can you say? (Just something like "memory-mapped,
8 interleaved bitplanes, just like TT-Low, but with more horiz. rez" will do)

>A cheap accelerator board (probably 16 MHz 68000) which seem quite cheap,

I use the ICD AdSpeed and it's a gift from heaven by my reckoning. It
significantly improved PageStream output and redraw times, I get better
results from telecommunication with the internet now that the cpu can
keep better tabs on the RS232 buffer so it can toggle the serial fix
RTS/CTS programs. And ARCing/LHArcing files is improved BIG TIME!
Don't hesitate to make this jump. It's worth it!

>The PD Overscan mod, which seems incredibly cheap!

I have also been considering this upgrade, seeing it in magazines at
around $100-$110. Anybody know for sure if this works properly with
PageStream? Flash? SpectreGCR? TouchUp?

>referring to the limitations of the internal drive - now that is a different
>story.

Well, I was kinda confused... I mixed up the september article
mentioned above and another one that appeared ni c't august '92.
In the latter one they note that the Falcon could serve as a
basis for a hard disk recorder, but that a drastic amound of hard
disc capacity would have to be added for this purpose as one
minute recording in CD qualtiy gobbles up 10 MB.
Regarding the data throughput speed, in the september article it
is said that the system bus is the bottleneck, it limits the
performance to 1 MB/s.

Hmmm.. further thoughts about Dungeon Master..

That's true about the Winged Key door at the bottom of the
Skeleon Key stairway.. maybe that's the door Rasmus was
referring to..

That door leads to a secret entrance to the Dragon's Room, from which
you can "hit and run" at the Dragon.. the first time I found m
way down there I somehow ended up with him trapped in there with
me... so I hightailled it back up the stairs and came back down
the regular stairs into the Dragon's Room, leaving him trapped
behind the wall..!

The Winged Key is however, well hidden..

The Mace of Order may make your party move faster, but that's
because it increases the Load capacity of the Champion who carries it..

When I noticed that the Jewel Symal (I think.. I've gotta find my
notes on this..!) seemed to be helping regenerate health points,
my ladies and I spent a somewhat painful (for us all) time
experimenting..

I'd throw a LO fireball at the wall, and time how long it took for
one of them to recover their health without the medallion, and
then again with the medallion.. over time, it became apparent
that it did help.. but again, not enough to make a big difference.

Did accidentally bump your party into the wall, and find yourself
apologizing to them...?

:)

>all, just using DUMB TERMINALS. You can always use multiple-screen
>interfaces (eg. "miwm" for MiNT, which even though it is a quick-hack,
>is still excellent; or for those keen - just port Unix "screens").

I know, I know... Before I discovered a room full of SUN IPC's I used
to work (well... read the news anyway) on some good old adm3a's. Now,
if any terminal is dumb, it's these ones.

>Multiple windows is not a pre-requisit for multip-tasking... though I
>imagine BigScreens will appear for the Falcon even faster than they did
>for the ST...

It mightn't be a pre-requisit, but do I like to have it! Some programs
don't run in bg nicely (they keep getting stopped for terminal output)
(Yes I know there must be a solution for that...). I like TOSWIN a
LOT; it gives me real XWindow-feeling; with the new Falcon GEM (I saw
screenshots; nice face-lift, with 3D-style windows) it would even be
Motif- or OpenLook-like. Whoopee!
I just like "A4-windows" for TeX-previewing and such. For that, I need
a big screen. I *can* open a 67-line window now, but with that tiny 6x6
font. And that's with 480 vertical pixels. So I would like to have
just a bit more on the Falcon, even if it's just in mono.

>But are you really going to plug a $1500 monitor into your $1000 computer :-)?

I've seen some reasonable XVGA monitors (768x1024), non-interlaced,
color, for under HFl 1000,- (Look in your local newspaper what the
exchange rate is... It's <600 US$).

WARNING UNFOUNDED SPECULATION AHEAD

Another method would be to simply wait a bit. Although Atari hasn't stated this explicitly, I have seen indications that they will also produce a Mega Falcon. Also, some of the magazines covering the Falcon treat this as an obvious fact.

I know there is a market of at least 1 person for such a model :-).

Message for Tim Gallivan, timg@landau.ph.utexas.edu

Hallo Tim!

I uploaded the new version Ghostscript 2.41 from lifshitz.ph.utexas.edu.
I installed it on my ST (1040STF with 4Mb memory and TOS 1.04).
When I started gs with

gs filename.ps

I got the error message

Initializing ....
Unexpected interpreter error -21

The error obviously occured during the initializing process. With
version 2.31 everything is ok, only with version 2.41 I get this
error. So the file gs_init.ps seems to be ok, and this must be a
bug of version 2.41.

The program gemgs seems to have a bug, too. Together with NVDI version
2.03 the program bombs, without NVDI it works, but the mouse pointer
looks like a busy bee all the time.

Please could you correct these two bugs, I want to use these
two programs. gemgs really is a very good program.

Thanks

From: thiele@quando.quantum.de
Message-ID: <1992Aug20.132439.25793@quando.quantum.de>
Source record: 218418

Hello everybody,

I have some questions about MiNT, the program `minit` and minix-
compatible filesystems.
I am using a MEGA ST (4MB), mint v0.95 and the init package. Now I
want to install a filesystem under MiNT, which uses file permissions.
There is a program named `minit`, which initialisize a minix-compa-
tible filesystem. Sorry, but I don`t have any documentation, so
I will be very happy if there is someone who can answer some questions:
- what is minit? Is it `only` a driver, or can it transform a normal
partition into a minix-filesystem? Can one use this filesystem
under MiNT without any problems? How can I install such a
file system????
- how does minit works? Are there any parameters neccessary?

I hope someone can help me a bit!

I'd guess you could run it as a normal Atari MINUS the multitasking extensions (which would probably take up the extra meg)...

> - The mouse port is still under the case, as in the 1040 series.

Too bad. I think the MegaSTe (and TT) have the best setup - the mouse port is VERY conventient (as well as the external keyboard).

> - Mac-formatted sound files can be used (they did this with a disk of
> Star-Trek sounds, associating the "transporter" sound with the
> opening of a window!)

Can be used in which way? There are already programs out there to use MAC SND files, either at bootup, or through a "viewer" (listener?). Unless the SND files I've used are CONVERTED from MAC files? I know there is at least one program where you can associate sounds to keyboard presses.

The only thing I which about the Falcon was that the keyboard was external. It's no big deal, but is VERY convenient. Oh well, I guess I'll have to wait for the Falcon II :-)

Hold on there partner - maybe you forgot just how that interlaced
stuff works - you scan the picture, skipping every other line of the output
video, and then fill it in on the next Vblank of the monitor. In this way
you get a simulated doubled verticle size - but of course since the phosphor
of the monitor is "excited" in one frame different from the next (especially
if they are of different colors) you get the flicker effect. I'm not certain,
but I think that there might be minor verticle displacements on alternating
video frames that are part of normal monitor operation - if so, this would
help the illusion that you have more verticle pixels, but you will still have
overlap and will still have flicker. Of course, if the Falcon can output 16
bit color (colour for you Brits :) at a 640x480's frequency, then yeah, you
shouldn't have a problem on multisyncs - but who's to say (yet) that they
didn't skimp on the video circuitry so that it _can't_ do it (ie. it can only
output 16bit color at 640x240 rates).

>Me, I'm impressed that they even BOTHERED to support high-res on the SC1224.
>You'd be a bit crazy to buy an SC1224 rather than a MultiSync, considering
>the slight cost diff, compared to the value you will get out of the Falcon's
>higher resolutions. The Aint No Such Thing As A Free Lunch, and your SC1224
>will never handle 640x480 non-interlaced.

Then again, the part of supporting the SC1224 was a _good_ idea. After
all, remember - who will be a big portion of Falcon buyers? They will be
current Atari users who probably have a SC1224 at home and are on a tight
budget. Thus _all_ they have to buy is the Falcon if they already have a
monitor (granted, not top of the line) at home. Not having to buy a monitor
is a BIG cost diff. At least $300 worth. And hey, you really should think
about that old "never say never" cliche'....

>Question: will 1280x480 interlaced be possible with a MultiSync?

I doubt it. Since it looks like you are looking at a 640 max (monitor) horiz. freq., there aren't that many more pixels you can squeeze into the visable portion of the screen beyond the 732 that was mentioned. More than that will probably give you diagnal streaks accross the screen because the gun isn't hiding fast enough during Hblank.

1819. Toppings for plain Vanilla

Newsgroup: comp.sys.atari.st
Date: 1992-08-20 19:39:39 UTC
From: churchm@gov.on.ca
Message-ID: <1992Aug20.193939.18455@gov.on.ca>
Source record: 218118

Hi. I'm new to this group so hopefully this is a good place to start.

I've had my good old 1040 ST for a number of years, and I've recently just upgraded to a Mega-4 STe. Up until now, I've really done nothing serious with it; but I'd like to start.

My machine is "plain Vanilla". I'm using almost no extra software; just the stuff that came with it (excluding things such as word processors, programming languages, etc.).

Can someone advise me on what I need to "spice it up". I've seen that people seem to be using different file selectors, GUI's, multi-tasking shells, etc. Where should I start, and where should I look?

Thanks in advance,

Mike.

Yes, send mail to user.name@Genie.geis.com - so for example, you might be r.selby@genie.geis.com (upper and lower case does not matter).

The user in question will have had to have sign up for the Internet gateway test on page 207. If they haven't, you'll get a message back from the gateway machine explaining this to you.

Well if they don't support 480 scanlines non-interlaced on a monitor that
can handle it, then it's useless. I doubt that would be the case. I think
the interlaced mode will just be so that poor old SC1224's (like mine) can
at least get SOMETHING out of the 480-line modes. My bet is it works just
as on the Amiga - interlaced for cheapo monitors, non-interlaced for multi's.

> the part of supporting the SC1224 was a _good_ idea. After
>all, remember - who will be a big portion of Falcon buyers?

Yes, let's face it. Atari has done The Right Thing. I was discussing with a
fellow the merits of excluding TT-High and creating a super-set of TT-Low
and TT-Medium in the 640x480x256col mode. I think it is right on the mark.
They have to keep the costs down. And I think they have.

>>Question: will 1280x480 interlaced be possible with a MultiSync?

> I doubt it. Since it looks like you are looking at a 640 max (monitor)

Oops, doubled the wrong figure... I meant "640x960"... too much bubbly-black-
american-culture that day.

>sure how these color-things are?

It is 16-bit, so yes 65536 colours. The question is, how. 15-bits
(32768 colours) would simply map to 32 shades-of-red x 32 shades-of-green x
32 shades-of-blue - ie. twice the colour accuracy of the STe (4x the ST),
and unrestricted palette (ie. true colour). Now, the last bit... well,
it could be a "half-brite" bit, or some such global effect - perhaps
thus giving even higher colour accuracy... but as for the TRUTH... who
knows... 32Kcolours is fine by me! At least it doesn't exhaust all
of your memory like 24-bit colur does (16Mcolours).

[stuff deleted]

The question is not "can they do it", the question is, why would you
want to? You were questioning just the 640x480 in interlace - on a multisynch
it would be much worse (usually lower refresh rate depending on quality of
monitor). Sure, you might be able to get full-page display out of it (I think)
but who wants to try to do DTP for more than 10 min. on an interlaced display?
You certainly don't want to do games where you have to track objects and blink
no more than once every ten minutes. :)

1828. GS and gemGS problems.

Newsgroup: comp.sys.atari.st
Date: 1992-08-21 03:07:57 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <78123@ut-emx.uucp>
Source record: 218434

Hi,

A couple of days ago, I made available a GEM shell for Ghostscript and a GS screen device that supports windows. I mentioned at the time that I had not tested them on color systems, and well, they don't work properly on them. Neither do they work properly on hi-res systems, but I didn't encounter the hi-res problem until I turned off QuickST. Both programs are usable on medium and high res systems, but please be advised that they will not look perfect. I will fix these problems as soon as I can, but my system is on the fritz right now and it may be a while.

GemGS has too many menu items for a low res screen. I don't know what to do about that. Also, can anyone tell me how to find the color of the current desktop background. When I restore the background myself, it is the wrong color.

Sorry for the problems,

-Tim

>Atari dealer who had seen the Falcon that this was the case. I'd love to
>fantasize about getting one, but I'm afraid that higher resolution is a
>principal concern of mine.

If you want high resolution now, get a Mega STE or TT and pop in a graphics card.

I believe the dealer is right, that the Falcon can go no higher than 640x480 (plus overscan). However, Jim Allen on GEnie has spoken of his dreams for connecting high-res Mac monitors to the Falcon, among other things like processor acceleration. But I think waiting for third-party hardware items to be released for the Falcon is foolish. I have no doubts they'll come, but when is the question, and you'll always seem to be waiting for them.

>was using the mupfel. That's the reason why there is a file
>$HOME/nn/param.mup (the extension mup is for shellscripts under the mupfel).

Could you give us (me) a little explanation of how you installed nn? I've got it part way there, but it start's with all groups unsubscribed. I've had to resubscribe to all the groups, and still have to run nn -g to get in, then tell it what group to start reading. Is this normal. I figured out that you had to run nnadmin EYW to start the nn database. It took about 2 hours, as I already had a news system up under hermes. Also, it seems to put 2 '/''s in some of the file names when it looks for anything in the $USR tree. I had $USR set to g:, which works fine under Hermes, but nn seems to hate it. I could move everything into a /usr folder, but would prefer not to. Also, if I try to reply or followup, it just returns without loading the editor. All I did was change the default editor to vi from me, as using ted to launch Tempus, like in Gus, didn't work. The version I have is nn13, and all it has for installation instructions is a brief readme which mainly describes changes from previous versions.

If anyone has the original installation docs, I'd appreciate having them mailed to me.

And on *that* note... Just thought I'd share with ya a little experience I've had (I actually reported this several months ago). After installing an ICD AdSCSI into my Mega, an interesting thing happened when I wrote to my hard drive. In monochrome mode, the screen would reset and display 1280x200 instead of 640x400. (On a multisync monitor. I haven't pulled my SM124 out of its box since I moved to California, tho mebbe I ought to just to see how it reacts.) I must say, it was rather disconcerting to have all the even pixel rows on the left half of the screen and all the odd rows on the right half, but a couple quick patches into Line-A fixed that right up and I had me a 1280x200 desktop. You should've seen the patched Overscan mode... This monitor is only rated at 1024x768 with interlace, but I coaxed 1440 pixels per row out of it. Tried for 1472 but the edges started to warp and bleed...

At any rate... (ah, sorry, no pun intended) I guess the moral of the story is that you never can tell exactly where your limits will be when messing with a multisync monitor. If I ever got around to outfitting my ST with a timing circuit to introduce an interlace delay, this quirk could actually be useful to me. As it is, it's just a strange curiosity, which ICD assures me I can cure by soldering a bypass capacitor onto the AdSCSI board. (I haven't done it yet because I'm still a little curious about what's going on... Who knows, maybe one day I'll find a need for a 1440x240 display.)

I remember reading about how the company that produced Autoroute for the ST said they were planning to drop it due to piracy. Sales were small and a company big-wig saw a pirate copy at a school he was visiting and this confirmed his belief. How a pirate copy in the hands of a child too young to drive can be viewed as lost revenue is a mystery.

The program cost over 100 pounds so to clear out the remaining stock the company dropped the price to 50 and sales boomed. Obviously most Car & ST owners thought that the 100+ price of the program was a bit steep.

Strangely and sadly this did not encourage the company to continue to support and develope Autoroute-ST any further.

Minit initialised a partition on your hard disk, or a floppy disk to either Minix V.1 or Minix V.2 filesystems. It is not a driver, minix.xfs is the driver which should be put in the same directory as MiNT so that it will be found at boot time.

> - how does minit works? Are there any parameters neccessary?

I can't remember, it's been such a long time since I used it. I suggest that you get the latest version of minixfs from atari.archive, I believe it has docs. You should find it in atari/mint.

>In particular, I am interested in..
>
>Knights of the Sky

From MicroProse, the same people who are guilty of F-19 Stealth Fighter -
full complaints list available from me on request. The main problem I
found here is that I can't do an Immelmann turn, even in training mode
using the Fokker Eindecker, the plane in which that manoeuvre was invented.

>F-15 Strike Eagle II

From the same people that did F-19.

Summary of F-19 - great graphics, not realistic, not much of a game.

>Birds of Prey (is this out yet?)

Will it be out for the Atari ST?

>Battle of Britain

Reasonable graphics (it uses bitmaps for the aircraft, meaning more detailed
aircraft but less detailed movement); reasonable realism (you can execute all
the manoeuvres you want, if the aircraft you're using it capable of it - do
not try to do a loop in a He 111); great game (single mission, campaign game,
build your own mission); poor opposition (you can dogfight a Spitfire while
flying a Stuka, and in some of the missions from the Mission Disk, you have
to). Overall, one of the few games I thought was worth the price, especially
as the manual is almost worth the price by itself. And it is copyable, and
can be installed on a hard disc - the protection is a code-wheel.

You might also like Armour-Geddon, which is not realistic in that it does
not simulate real aircraft, but is realistic in that it simulates flight
very well, even though certain things (retracting undercariage and flaps)
are missing. You also get to play with a helicopter and some ground
vehicles. The game is tough but fun (for me, anyway). Another one that
I did not regret paying for.

1836. Games on my STe

Newsgroup: comp.sys.atari.st
Date: 1992-08-21 10:03:47 UTC
From: otv@hal.nta.no
Message-ID: <1992Aug21.100347.526@nntp.nta.no>
Source record: 218443

Hello!

I never thought I would ever say this, but: I am a little bit curious about what computer games are all about. So, would someone please recommend what they think are the best games availeable as shareware/freeware for my 1040STe. I know *nothing* about computer games. I have only tried STETRIS which I found quite amusing. I have looked in a.a but where should I start? There are hundreds of them!!

I am 31 years old, so I don't think the different war/action-games will be my favourite. But perhaps some kind of IQ/coordination/creativity demanding games.

Thanks in advance!

- Oddvar Tveito

1838. What is Multidesk/Hotwire?

Newsgroup: comp.sys.atari.st
Date: 1992-08-21 12:36:17 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1992Aug21.123617.23297@aston.ac.uk>
Source record: 218444

Well, I've seen these two programs referred to in various PD/Shareware programs I've got, so I thought I'd ask what they were. I get the impression that Multidesk deals with DA's (What intuition, huh? :) and that Hotwire is a kind of replacement desktop. Is it compatible/ even worth using if I've already got Neodesk 3.0? Probably simpler to e-mail me than post, as I get the impression that everybody knows all about this except me... :(

I've had extemely good luck with ICD's AdSpeed. It seems to be compatible
with everything in 16MHz mode except for the MiGraph handscanner (the Mega
STe in 16MHz mode doesn't work either). But you can switch to 8MHz and
everything is fine. With AdSpeed you can switch speed with software,
keyboard or a mechanical switch if you want to add one in. The speed
increase in graphics programs is nice. It also works very well with the
Spectre GCR.

If you have any other questions, please let me know.

Source record: 218445

hyc@hanauma.jpl.nasa.gov (Howard Chu) writes:
>Who knows, maybe one day I'll find a need for a 1440x240 display.)

Your experience with multisyncs is similar to mine under X (-Windows) on a 486 machine running mach. The 386 X server lets you select your video mode by actually setting the horizontal and vertical timings. By tweaking these I was able to do 1152x900 (which is as much memory as the card had) on a decent (but not great) multisync. I'm sure you could do even better on a good monitor like a NEC 3FG or Sony 1304 (if you had the memory, of course).

In June I saw a Falcon protoype running in 16-bit 640x480 mode and while it was obvious that it was interlaced it looked OK on an SC1224. Since that was a prototype, I can only assume things have either gotten better or at least stayed the same (which would be fine).

The only problem I have with their video modes is that the one they really want to push for games (16-bits-per-pixel) is way too piggy for a 1 or 2 meg machine. Just one screen at 640x480x64K resolution is 600K, and you'll want to have at least two for page flipping. That about squares it for one and two meg machines right there. (And don't forget that you'll want plenty of 16 bit sampled sounds in there too!) When I mentioned this problem to them they didn't seem to "get it." Oh well...

The minimum standard RAM configuration for the Falcon should be 4 megs if they want game companies to write for that mode. (Game companies always write for the least common denominator so they get the biggest market.) And RAM is cheap. IMHO, they should trade in the 1 meg SIMMS for a single 4 meg SIMM in the base model. (Of course, looking at the specs you can see how much they value *my* opinion! :-)

Well, if you can figure out a patch to swap x->y, and y->x, and then turn your monitor on its side, you can get yourself a full-page monitor - albeit a little skinny. :)

BTW, what machine did you pull this stunt on? ST or STe (I don't know if the Ad board works on STe, so I thought I'd ask)?

> -- Howard Chu @ Jet Propulsion Laboratory, Pasadena, CA

-Mike

PS: This is a bit beyond my realm of "knowing" and into guessing, but don't video signals output an Hsynch signal? If so, it sounds like half of the Hsynch signals are being blocked. Then the multisynch monitor compensates for the funky signal...but I guess your monitor is a cut above the normal as ratings are really just minimums...of course it probably helps that it only has to deal with half as many scan lines.

> HAVE 480 scanlines to use! The VGA/MultiSync monitors will not experience
> the flicker - just as they don't on the Amiga.

You are seriously confused here, do you know what interlaced video is?
I said 480 lines *interlaced*, which is 240 lines really and quite possible
on an SC1224. That is the whole point of interlacing! You're also
wrong about VGA monitors on the Amiga - it ALWAYS FLICKERS at 400 lines
unless you have a FlickerFixer or an A3000. The standard Amiga itself
produces interlaced video at 400 lines resolution, it's not a monitor issue.

> Me, I'm impressed that they even BOTHERED to support high-res on the SC1224.
> You'd be a bit crazy to buy an SC1224 rather than a MultiSync, considering

I can't believe you said that. What about the entire existing user base
who ALREADY HAVE SC1224's? Sure would be nice if they could use their
existing monitor, eh?

> The Aint No Such Thing As A Free Lunch, and your SC1224
> will never handle 640x480 non-interlaced.

Agreed, but that is not at all what I said, nor what Tramiel said on Genie.
Try reading the article next time. :-}

No kidding, a bit too skinny... But it's certainly been entertaining to see what kinds of programs can and cannot cope with really weirdo screen sizes. I was quite disappointed to find that the version of Uniterm I hacked to work with Overscan failed in this mode, had to fall back to Zmodem. (Just a brief aside - I've come to learn that an 80x50 text screen is tremendously more useful than a 160x25 screen....)
>

Yeah, not only the hsync, but the video blanking appears to be missing. This is not a case of the signal being externally suppressed, as far as I can tell. The other funny thing about this situation is that simply writing the current value of the ShiftMode register back to itself restores the normal 640x400 monochrome screen configuration ($ff8260).

> Which is definitely wrong!
> Even for the simple 68000!
> What do you think are the pins ~BR(bus request),
> ~BG (bus grant) and ~BGACK (bus grant acknowlege) for?

Just a precision: with caches, you generally don't use BG and the likes
to solve the problem of simultaneous access to shared memory: each
processor has his own local bus!

The main problem with 27 processors is that shared memory is not applicable:
this memory would be too of a bottleneck!
but until 10 or so processors, it is definetely 'makable' although
surely (much) more expensive than a 68030 (or even 68040) monoprocessor
system!

That's the whole point: the processor price doesn't decide the system price !

Cheers,

Stefan Monnier

1858. uucico 3.42

Newsgroup: comp.sys.atari.st
Date: 1992-08-22 17:48:12 UTC
From: geoffc@zebedeeUUCP
Message-ID: <6411427@zebedeeUUCP>
Source record: 218476

Thanks for the new version of uucico that was posted recently, it works fine with Mercury 1.18. I have tried upgrading to hermes but every time I request it from atari.archive it doesn't arrive - it's in the telecomm index OK though and I can get other stuff OK.

My main question is though, what's cicostat.prg for ??? I've setup all the environment variables it needed but it only appeared to move uucico.log to uucico.bak. What else does it do ?

PS: which is faster at 2400baud MNP4, e-protocol or g-protocol ? I normally use g but when I tried e the cps rate looked to be slightly higher.

Cheers

Z*NET NEWS SERVICE
8/21/92

FIRST REPORT FROM DUSSELDORF

Nathan Potechin of DMC Publishing, Inc., filed this first report of the huge Atari show in Germany. The information came via telephone from the floor of the Atari Messe ("Fair") in Dusseldorf, Germany, and was transcribed by John Nagy of the Z*Net News Service at Nathan's request, and has been uploaded by Z*Net to GEnie. This news release may be reprinted, excerpted, or re-posted on any other telecommunication service ONLY with this notice intact. The Atari Roundtables on GEnie are *official* information services of Atari Corporation.

ATARI AT ATARI MESSE - THE NEW WAVE BEGINS

Every year, Atari holds a huge trade show in Dusseldorf, Germany. Spanning roughly four football fields of floor space, the show this year is similar in size and attendance to last year's event.

The announcement of the Falcon 030 to the largest Atari show in the world was the first order of business. According to Nathan Potechin, "there are Falcons all over the floor of the show, in almost every booth." Clearly, the nearly-accurate profile of the coming machine offered by most of the Atari media across the last months was not missed by the showgoing Atari Messe audience, and the excitement in the crowd was high as they saw it firsthand.

Many vendors had new applications that expose the power and features that are new on the Falcon 030. DMC Publishing (Calamus) again had the largest booth on the floor, spanning 4,000 square feet with about 40 people working in it alone. Other large booths included TMS, Matrix, 3k, and Maxxon. Many new products were shown, and we will report on them in detail in a later release.

MARKETING PLANS, PRICE FOR FALCON IN USA

The hottest news at 5:00 PM Friday evening in Germany after the close of the first day of Atari Messe was the unveiling not only of the Falcon, but of the plans that Atari has to market the new machine in the USA.

The "base" Falcon 030 will retail for $799 in the USA in a one-megabyte configuration. The next option up the scale will be a four-megabyte RAM with 65 megabyte hard drive Falcon at $1,399.

Sam Tramiel told dealers and developers at an afternoon meeting that the US launch will begin immediately with regional marketing build-ups. Individual regions of the USA will be targeted, one at a time, with major "dog and pony shows" to both woo and educate computer dealers. "Serious" co-op advertising money will be offered to dealers who join in the roll-out. Once enough regions are served by an operating dealer network, Atari will launch a national advertising campaign.

Industry observers suggest that this plan will make the most of Atari's cash and production resources. By serving a small but growing dealer network with product, on-board Falcon dealers can be more assured of delivery of product during the build-out stages of the plan. Dealers will help and be helped in promotional costs, enabling Atari to make a bigger splash in smaller ponds with less of their own money, and allowing Atari's resources to go towards increasing production of Falcon computers. As production and sales increase, so will revenues with which to attack new regions. Meanwhile, Falcon specific software will mature and present a solid base for the later national marketing efforts.

More details from Germany will be coming later in the weekend. Look for more special reports on GEnie, a service of GEnie and the Z*Net News Service.

To sign up for GEnie service, call (with modem) 800-638-8369. Upon connection type HHH (RETURN after that). Wait for the U#= prompt. Type XTX99436,GEnie and hit RETURN. The system will prompt you for your information.

1860. Developers and Dealers mistreated by Atari?

Newsgroup: comp.sys.atari.st
Date: 1992-08-22 23:25:48 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Aug22.232548.15976@usenet.ins.cwru.edu>
Source record: 218477

I have talked with a few developers and dealers that feel they
have been mistreated by Atari to say the least.

I have been told that they hesitate to do business with Atari
because of it.

I believe this is a serious problem and I would like for you to
let me know if you have been mistreated.

If you don't mind, I would also like to know how you were mistreated.

Do you feel there is a problem?

I may be sending Atari a letter to let them know about this problem
and would like to know how serious it is.

No names will be mentioned.

Thanks.

Len

>
> Could you give us (me) a little explanation of how you installed
>nn? I've got it part way there, but it start's with all groups
>unsubscribed. I've had to resubscribe to all the groups, and
>still have to run nn -g to get in, then tell it what group to
>start reading. Is this normal.

Due to the time lag of getting replies, I'm following up my own message,
to update what I've figured out about installing nn on hermes, hopefully
it will help others with problems.

First problem I found a solution to had to do with the USR variable.
Hermes was quite happy with g:. as I used the drive itself as a usr
directory. Also, I had moved NEWS to another drive, as 16meg wasn't enough
to run a news system when I went out of town for any length of time.

Second, you have to change the ACTIVE variable as nn trashes hermes'
active file when buildact runs. Fortunately, nn uses the usr/lib path
to find active, while hermes uses the ACTIVE variable, so defining
that to something like active.hrm allows rnews to read a file it can
understand, and nn can do what it likes with lib/news/active.

Third, after every poll of your're feed, you must run buildact after
rmail, then nnadmin -EYW to update nn's database.

Fourth, If you call nn and get " no news is good news", try nn -g.
Start with alt. when it prompts for a group name. Enter the first group,
and chck the top status line. If it says UNSUB, hit 'U' to resubscribe.
You will have to do this with every group you read. You can advane though
unsubscribed groups with 'A', and subscribe to each one. Also, if you've
been using hermes, and don't have all the CURRENT.USR variables set, you
should use herme's login program to log into nn, as this will set the
currentuser variable so nn knows who you are.

These hints should get you to where you can read news with nn, but
here's where I need help. I can't figure out how to set aux.ttp to allow
me to post. The readme mentions aux.mup/doaux.ttp. but the release has
only aux.tt, and no clue as to what should be in the .mup file. In my init
file, I've set the mailer to mmail, martin's mailer from hermes. I set
inews to mrecmail, but in hermes. mmail handlers boith news and mail

posting. If I try to followup or reply, nn returns, announcing that nothing was done.

Can someone using nn explain how to set up aux and init to post or mail using hermes? Also, does nn handle mail reading, or is that only possible with elm or mail? Thirdly, is there anywhere to put mailing addresses for moderated groups, and anyway to tell nn which groups are moderated?

Ah, thanks Stefan.
That'll teach me for going to German archive sites... lots of nice software
though... almost worth learning German for! :-)
I didn't know what it was when I got it... just got a shock when I saw
it was over 500K that I had just ftp'ed!

After running it, i'm hooked I think.... it's a great replacement desktop.
I'll have to go get the english one now.

1865. CLA V1 - multiple inputs?

Newsgroup: comp.sys.atari.st
Date: 1992-08-23 14:19:39 UTC
From: Mike Stramba <stramba@zooid.guild.org>
Message-ID: <1992Aug23.141939.16360@zooid.guild.org>
Source record: 218488

Is anyone using the program CLA v1, the digital logic design and simulation package?

If so, do you know how to draw multiple inputs to one gate?

The docs mention something about connecting mul. inputs to a 'driver' gate?

I can't see any driver gates in the 'gate' dialog.

I don't know a lot (if anything about digital circuits/electronics.
Is there such a thing e.g. as an 'and' gate with more than two inputs?

Mike

From what I've figured out, it mails a copy of your uucico stats
to cicostat, which you create in your mail alias file. If you haven't
got hermes, I don't think Mercury supported alias's.

>PS: which is faster at 2400baud MNP4, e-protocol or g-protocol ? I normally

The e protocal does no error checking, so if MNP4 is error correction,
use it, as it should speed things up.

jhenders@jonh.wimsey.bc.ca (John Henders) writes:

>In <H.UjJFyVrP2F2@jonh.wimsey.bc.ca>, John Henders writes:

Here's me following up my own article again. I got nn to work, and post.
This is posted from nn, so if you're reading it, I guess it all works.
For my system, because I had $USR defined as a drive, rather than a file,
I had to go into the various nn* programs and use a hex editor to change
sme strings. In many places, there are strings like ${USR}lib\something
or ${NEWS}something\something else. By sheer good luck, there were 2 00
bytes after these strings, so I was able to add a backslash between the
variable and the rest of the string and still have a null terminating byte.
This is important for running with Hermes, where variables leave off
the trailing backslash, as is usual with most environment variables.
The one program that gave me trouble was buildact, which did not
have 2 00's, but fortunately, I was able to run it through a disassembler,
change the string, and reassemble it.(no one said this stuff was easy ;-)
I will make my patched version available if there's enough demand.

Date: 1992-08-23 16:10:00 UTC
From: undermind!cmc@overmind.mind.org
Message-ID: <2223370@overmind.citadel>
Source record: 218483

I certainly do understand your setup, having an identical one here. I wonder why they did not simply put a MegaBus passthrough on the card? does anyone know? The documentation specifically says that your slot must be either unused or the device on it must have a passthrough. I think the AdSCSI that installs internally has one, why doesn't the Bus-Bridge TEC upgrade? Anyway, I'd say check out the items you're looking into buying... you might luck out and discover that they already have a passthrough on them. :)

Let's see if I've understood this interlace-thing right :

Falcon uses interlace to produce the 480 vertical resolution, if you
are using a normal monitor. If you are using a VGA or a MultiSync, it
will not be interlaced. Is that right?? Or does Falcon use interlace
even with a Multisync or a VGA?

Who ported this 2.41 to the Atari?
Perhaps he should concentrate on 2.5, which is the current version.
BTW: I'd like to have a color TT-VDI-driver implemented !!

What does gemgs do? Never heard about it. Sounds interesting!
If these bugs are fixed, someone should upload it to a.a.

Regards, Markus.

> output accelerator. Could anyone enlighten me, also about
> speed compared to Turbo ST? Thanks in advance,

It is not really faster, BUT:

It is not just a screen accelerator: it is a entirely new VDI which
means that it is clean, fast, adds some new functionalities (like GDOS
or some functions from GEM 2.0) and is much more compatible (for
example, it is not screen dependent)

It is a VDI replacement as opposed to Turbo ST (or alikes) that are VDI
extensions !

1877. ShadowTerm II - Uploaded on GEnie. Could some kind soul...

Newsgroup: comp.sys.atari.st
Date: 1992-08-24 04:33:02 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <RHuZPB1w165w@ersys.edmonton.ab.ca>
Source record: 218492

Hi.

ShadowTerm II has been uploaded to GEnie (File #25398 SHDWTERM.ARC).

I have had numerous problems getting it to atari.archive and comp.binaries.atari.st and have come to ask some kind soul to download it from GEnie and upload it to these areas. CompuServe would be nice too, since I don't have an account there. (Perhaps I am wishing on a falling star on this point, though.)

The original file (ZOO) had problems. Or rather, ZOO had the problem extracting the directories. I changed the file to an ARC 6.02 archive (since I have little idea how to make LZH use directories and I will most likely never be able to read German).

If anyone could take it upon themselves to do this, I would be forever grateful.

1878. Official Falcon Specs

Newsgroup: comp.sys.atari.st
Date: 1992-08-24 18:15:00 UTC
From: Thomas_Leonhaeuser@f.maus.de
Message-ID: <A14190@F.maus.de>
Source record: 218354

Hello,

i've been on las Sunday in Duesseldorf "Atari Messe" and here are the official
Specification of the Falcon 030:

- 680030 CPU 16 MHZ (with cache)
- optional FPU 68881 / 68882 16 MHZ
- RAM 1, 4, 14 MB
- ROM 512 KB
- BLITTER 16 MHZ

Video:
- VGA 640 x 480 x 256 collors (from 262.144)
320 x 480 x 65.356
320 x 480 x 32.768 with overlay-Bit
- RGB/TV 768 x 480 x 256 from 262.144, interleaced
768 x 480 x 65.536 , interleaced
768 x 480 x 32.768, interleaced with overlay Bit
- all ST-modi
- Hardware-overscan option
- Hardware scrolling

Coprocessor Subsystems:
- DSP 56001 32 MHZ 32K x 24 Bit SRAm. 0 Waitstates
- Blitter, 16MHZ, kompatibel to ST-Blitter

Ports:
- Paralel
- RS-232 / Modem
- Midi in
- Midi out/through
- Cartridge-Port
- SCSI II (50 Pin connector) with SCSI-DMA
- LAN (compatible to MEGA STE and TT)
- mouse

Sound:
- 16 Bit D/A A/D converter
- Stereo input and output
- 8 channels 16 Bit recording and replay (max. 50 KHz sampling frequenz)
- 3 channel PSC sound (ST)
- connector for Digital audio and DSP

Joystick:
- 2 x STE compatible
- 2 x standard

Floppy:
- 1,44 MByte

Harddisk
- intern optional IDE-bus Harddisk (2,5")

allso
- realtime (??) clock with battery
- expansionbus with all important things CPU, bus-control, Interrupt ...
- RAM-Bus

Bye ____
/homas L.

P.S. Sorry for any mistackes in the Text

Dell, AST, Gateway, ALR, and others are making billions a year selling inexpensive PC clones. They've already go 66 Mhz 486 machines out the door at the same price ($2495) as 33 Mhz machines cost a few months ago. They're working on very small margins (nothing new to Atari) but they make up for that by selling tens of thousands of machines a month. Gateway alone grossed $600M last year and sold a few hundred thousand machines. With a market of 10 million PCs in the U.S. each year, you'd think Atari would have a half decent chance of getting even a small market share, but from what I've heard they don't even bother to produce the Atari ABC machines anymore. Way to go. What are they waiting for? Cheaper DRAMs? <grin>

Wang, well, that's not exactly a name synonomous with PC clones! Clones are not their main business. From what I've read their problems are that they were deep in debt, didn't adapt quickly enough to create new products, and they hired someone to lead the company who didn't really know what he was doing. And when was the last time you saw a Wang advertisement? Atari sounds like another Wang just waiting to happen!

- Darek

The e-protocol is faster but never use it. If you are using MNP4 or V.42 you
have error correction between the modems and won't lose data between the
modems. But what is with the cable between your modem and the dte (computer)?
If you didn't use a very good isolated cable you'll lose data between the
modem and the dte.

regards,
Alf

1881. Re: how to install nn?

Newsgroup: comp.sys.atari.st
Date: 1992-08-24 23:10:04 UTC
From: olaf@oski.toppoint.de
Message-ID: <9208242858@oski.toppoint.de>
Source record: 218383

I was informed by some forwarded mail and a mail of jhenders (my reply
bounced just at the last site on the way to you, please check that,
your host is lacking an MX record for you), that there suddenly is
trouble about a version of nn for ST, and now, after all I read,
I guess, its my version.

I'm very sorry, that it causes so much trouble. Over a year ago I posted an
installation guide to the german part of the net demanding every archive
admin to incorporate it into their copy of nn, but it has been naive to
think that would help.

I will post it again after this article. It will not solve all problems, as
the configuration, nn was aimed at, is very special (Gemini, Mercury UUCP or
Digital Island UUCP), but there was nothing else (as far as UUCP systems for
ST computers are concerned) available at the time NN was ported. I have no
experience with Hermes, although the mmail.ttp incorporated in the nn
distribution is a very ancient predecessor of mmail coming along with
hermes. It is true that the shell used has to support the following features:

_shell_p hook
ARGV argument passing
strings can be quoted without any processing by ''

I heared there are older versions of gulam still alive which do not
know about _shell_p or ARGV.

Read the installation guide with special care for environment variables.
nn uses a lot of environment variables standard in Unix, but not normally
defined on an ST (HOME, LOGNAME, USER). I hope its all in the docs.

I will stay tuned.

1882. Installation Guide for NN 6.4.11 ST

Newsgroup: comp.sys.atari.st
Date: 1992-08-24 23:30:39 UTC
From: olaf@oski.toppoint.de
Message-ID: <9208242962@oski.toppoint.de>
Source record: 218382

[In case I said anything different from what is stated in this document,
this document is right, and I've been wrong.]

How to install NN 6.4.11 ST

Olaf Schlueter <olaf@oski.toppoint.de>

Advice

`Read them,' said the King.
The White Rabbit put on his spectacles. `Where shall I begin,
please your Majesty?' he asked.
`Begin at the beginning,' the King said, very gravely,
`and go on till you come to the end: then stop.'

Lewis Carrol, Alice in Wonderland

1. Requirements

To run (and need) NN 6.4.11 ST you need a working news system. This
usually consists of a hard disk partition big enough to store incoming
news for a reasonable long time, and either the Mercury UUCP Modules or
the MNews Implementation for the Atari ST. NN has been tested with both
and tools are included in the NN.LZH archiv to let NN cooperate with
both. Nevertheless, MNews is recommended, as it has fewer bugs and makes
using of hard disk space more efficient.

Next, you need a shell, a command-line interpreter, which is not
normally coming along with your Atari ST. This shell is not needed as a
user-interface, but as a program running beneath NN, called by NN via
the _shell_p pointer hook. The shell used for the NN development has
been Gemini, a shareware desktop available at several atari archive
sites. If you have Gemini, you are lucky, since NN was written with
this excellent shell in mind, and the author himself did not test it on
other platforms. However, it is reported, that NN works with Gulam and
a couple of other shells too. For you to decide, whether you have to
get Gemini (or at least Mupfel, the command-line part of Gemini - in
case you are short of memory space), you will find a list of commands
the shell must be able to perform when called via _shell_p in section 2.3.

Finally, you need a text editor, which must NOT use GEM (as NN doesn't),
for posting/mailing within nn. There are several of them available
and I do not include any of them in the distribution. Note, that
NN knows certain editors, MicroEmacs and Vi, better then others, if the
program is called `em' or `vi' respectively.

2. Environment

Another beast not normally found on an Atari system is the environment. NN makes heavy use of this feature and again you need a shell or another tool to install an environment. Conceptually speaking the environment is a set of variables named in uppercase letters and their contents, which are simple strings. These variables may be set by a program and are available to all other programs started by it. I.e., if your shell defines an environment, the settings defined may be read by NN, if NN is started by that shell.

Most shells offer a setenv command like

setenv HOME my_castle

which defines the variable HOME to have the (string) contents `my_castle` or a BASIC like directive like

HOME=my_castle

(Gemini/Mupfel offers both) and a feature to let you define an environment when starting the shell by the use of a kind of startup file. See the documentation of your shell how to define an environment during the startup of the shell.

2.1 The environment needed by NN - Personal Information

Some information NN cannot figure out without asking you, but this information stays always the same at every time you start NN, and you surely do not want answer NN's questions every time NN is coming up.

At first, NN needs to know, who you are (that won't change pretty often, eh?), and what the name and domain of your site is in the USENET. These names are defined by the environment variables USER (your username for mail purposes), SITENAME (the name of your computer) and DOMAIN (the name of the Domain your SITENAME is unique within). For example, the authors USENET Adress is olaf@oski.toppoint.de. Due to USENET mail address rules, the USER is olaf, the SITENAME is oski, and the DOMAIN is toppoint.de. So I use the following settings:

setenv USER olaf
setenv SITENAME oski
setenv DOMAIN toppoint.de

Next, NN creates temporary files (files which are destroyed immediately after use) every now and then, and this is normally done in a certain directory, which may be a ram disk for the sake of speed. This directory is reported to NN by the environment variable TMP. On my system the temp directory resides on C:\TMP, so I say

setenv TMP C:\TMP

Furthermore, NN assumes that you are using a certain directory for your private purposes, i.e., a directory not filled up with programms, configuration files etc. but with your personal data like mail, texts you wrote and so on. On Unix systems the documentation refers to this directory as your `home' directory, and this give reason to the naming of

the environment variable HOME, which tells NN where your HOME is. My HOME is D:\usr\schlut (in the world my computer is able to realize), and so I say

setenv HOME D:\usr\schlut

If you are the only one using NN (and all the other USENET stuff) on your computer, then there is no problem to set these variables in a startup file once and for all when you start your favorite shell. If someone else is using NN too, you should think about a way to change the HOME and USER setting to introduce this other user to your system. No tool is included in the NN distribution for this purpose, but it is easy to develop one.

2.2 Environment needed by NN - Information about your hard disk structure

Another thing NN needs to know is the location of several data on your hard disk. Among these are the location of the news directory tree, and certain configuration directories.

There are a lot of different directories used by NN, and it would be a waste of memory to assign a environment variable to every directory. Instead NN is satisfied with a set of two variables, if you install a certain structure on your hard disk. These two variables are USR and ETC which contain root directories for the rest of the others. The following list tries to tell you about the directory structure in a compact manner. The prefixes $USR and $ETC are placeholders for the actual contents of USR and ETC, i.e., $USR\lib\nn stands for F:\usr\lib\nn, if USR happens to have the contents F:\usr.

$USR\spool\news # the root directory for the news article tree
$USR\spool\news\.nn # a directory for nn's database (we will talk
about that later)

$USR\lib\nn # a directory for nn's help files and other things
$USR\lib\nn\help

$USR\lib\news # a directory where the active file of the
news system lives.

$USR\adm # a directory where logfiles will go

$ETC # the passwd (see later) file will live here.

This directory structure is defined more strictly and elaborated in a paper called the HH standard (HH stands for Hansestadt Hamburg), which also defines a couple of other enviroments settings and file formats. NN follows this standard with one unimportant exception regarding the temp directory (the HH standard allows 4 different variables to introduce this directory, but NN insists on TMP) and an important exception as it requires a shell in the background (I said that before, didn't I?).

Now look at the directories listed above and their meanings. You already may have some of them, namely $USR\spool\news (although it may be F:\news or what on your system), and $ETC since even Mercury UUCP Modules makes use of a passwd File.

So you may set $ETC to the directory where the passwd file lives. If your news directory does not fit in the $USR\spool... scheme, you may explicitely set it with the environment variable NEWS (which is still a HH standard variable). $USR is nevertheless required to find all the other directories which must be in $USR at the places mentioned in this paper.

On my system, the news articles are stored in E:\usr\spool\news, and anything else belonging to $USR starts with E:\usr so I say

setenv USR E:\USR

My passwd file is C:\etc\passwd, so this is set by

setenv ETC C:\ETC

IMPORTANT: Once you have installed the settings of USR and ETC, you have to follow the scheme as defined by the HH standard. All informations regarding NN are contained in this readme, but for other programs which explicitely state that they follow the HH standard, you have to install their directories according to your actual setting of USR and ETC instead of changine the contents of these variables. You may obtain the HH standard description by asking me via E-Mail for it.

2.3 Environment of NN - Location of programs

Finally, NN calls several other programs at several places. It uses the shell (remember _shell_p!) fur this purpose rather then executing programs directly, making it possible this way to put the executable programs anywhere on your hard disk.

Most shells offer the feature to tell them a list of directories which contain executable programs using the PATH environment variable. Hunt through your shell documentation for a feature like this. Normally, the directory list is seperated by colons or semicolons. I use the directories C:\bin and C:\usr\bin for executables and my PATH variable therefor reads

setenv PATH "C:\bin;C:\usr\bin"

(The quotes are necessary in Gemini to avoid misinterpretation of the semicolon).

If your PATH variable is correctly set, you should be able to call a program like C:\bin\em.ttp by just saying

em

to the shell. NN calls every program without a full pathname and without an extension (.ttp or .tos or whatever) by telling only its basename to the shell. If your shell does not support this, you are in

trouble.

The following programs and commands (in addition to those contained in this distribution) are called by NN (especially when posting or mailing articles).

```
echo args... # outputs its arguments to the screen
rm -f file # removes a file without bothering whether it exists
cp a b # copies file a to file b
mkdir a # creates directory a
cat # copies a file or its input to its standard output
```

The following is seldom used (only by nnadmin), so you may live even if your shell does not support it.

```
ls -l pattern # list the directory contents matching pattern
# note that pattern is a Unix style pattern not
# an MSDOS style.
```

2.4 The editor to use - EDITOR

At last, you need the environment variable EDITOR. It should contain the command name of your favorite text editor. This text editor should not use GEM but rather be a TOS program. I recommend MicroEmacs, which , if called `em.ttp' or `em.tos', is better supported by NN then others. (NN also knows about `vi'.)

```
setenv EDITOR em
```

3. Making directories

Now, after defining the meaning of the USR and ETC environment variable, we are going to create directories, which are needed by NN, but not normally by your other News and Mail software so they probably won't exist. Since there is no standard shell coming along with the atari, we have to do everything by hand - there is no installation script.

The easiest way to get the directories is to unpack the archiv and let USR and ETC point to the directories usr and etc created during extraction of the archiv. If you dont want that for any reason, the directory structure created by the archiv will still be useful as an illustration of what is going on now.

In the following, I will repeatedly refer to the "directory, which is defined in the environment variable XXX". To avoid this lengthy idiom, I will use the notation $XXX to refer to the contents of XXX.

At first, of course, we should check whether $USR or $ETC exists. Make them if needed. (If $USR did not exist before, that implies that your news articles did not fit in the $USR\spool\news scheme - remember to define NEWS to point to your news directory!).

The HH standard and NN require two subdirs in $USR:

$USR\adm # for logfiles
$USR\lib # for configuration and help files of certain programs

and again $USR\lib needs two subdirs:

$USR\lib\news # for the active File
$USR\lib\nn # for nn's needs

The last directory must contain a subdir

$USR\lib\nn\help # nn's online help

Finally, we remember that there is a $USR\spool\news\.nn (or $NEWS\.nn) directory, which is new. Make it and a subdir DATA in it.

$USR\spool\news\.nn
$USR\spool\news\.nn\DATA

4. Copying Files

Now we are ready to move the files of the distribution archiv to the places where they belong. After you have unpacked the archiv you will notice that it resembles very well the directory structure described above. The directories contained in the archiv are:

usr\lib\nn # NN's aux files
usr\lib\nn\help # NN's help files

usr\lib\news # where the active file of the news
system should be

usr\lib\mercury # see note below

usr\spool\news\.nn # NN's database
usr\spool\news\.nn\DATA

etc # the passwd file is here

usr\bin # the executables
bin

NOTE: If you are using Mercury UUCP, you may already have a file named active somewhere on your disk. If it happens to live in $USR\lib\news, you have to move it to somewhere else or rename it and change the appropiate field in config.sys. It is field 0012. Check it NOW!

No copy the contents of usr\lib\nn and its subdir help to $USR\lib\nn (and $USR\lib\nn\help).

Then copy the contents of usr\bin and bin to one or several directories listed in your PATH environment variable.

5. Localizing some files

A part of the localizing procedure has been described earlier in the environment topic. You should now have configured your shell so far that the necessary environment variables are defined when the shell has

started.

5.1 /etc/passwd

Under normal circumstances you probably will have a /etc/passwd file.
To make sure that it has the correct format, I describe the passwd file
format as described in the HH standard, a format which is used by Unix,
newer Mercury UUCP (>=1.16) and, of course NN.

The passwd file contains one or several lines of the format

username:password:uid:gid:Voller Name|Organisation:Home-Dir:Default-shell

To illustrate the meaning of it, here an example

olaf::0:0:Olaf Schlueter|Toppoint Mailbox e.V.:D:\usr\schlut:C:\bin\gemini

The fields are seperated by :, which cause an ambiguity in the HomeDir
field and shell field, but this is correctly resolved by the routines NN
is using to parse the passwd File. The informations NN takes out of
this file are the full name (Olaf Schlueter) and the organization
(Toppoint Mailbox e.V.) by looking up the line in the file that matches
the username defined by the environment variable USER. Although the
passwd file contains an entry for the home directory of a user, NN does
not look at that but insist on having a defined HOME environment
variable.

So you should have a line in your passwd file with your
username, your fullname and your organization. The others fields of
this line should not be empty, but their actual contents is not
important (as far as NN is concerned).

5.2 Adapting NN to Mercury UUCP

One file needs to be adapted to Mercury UUCP and one possibly needs to
be created. The first file to look at is the config.sys file used by
Mercury UUCP.

If you moved the news directory ($NEWS or $USR\spool\news) to another
place during installation of NN, you should check, whether it is
correctly defined in config.sys. It is field 0018 in config.sys.

Finally, create an empty file named "alias" somewhere and append a line

#!0102 "<complete path to alias>"

to config.sys. <complete path to alias> stands for the actual pathname
of course. On my system the file is E:\usr\lib\mail\alias, and my
config.sys has

#!0102 "E:\usr\lib\mail\alias"

Now, check whether your news spool directory ($NEWS or $USR\spool\news)
is in the right place. Then you should have a file $NEWS\news.def or
$USR\spool\news\news.def. If not, reread this paper. $NEWS or

$USR\spool\news should by the directory, the news article tree starts in.

Otherwise, you run

buildact

from your shell. This will create a Unix compatible (and NN compatible) active file in $USR\lib\news\active.

5.3 Adapting NN to MNews

MNews is another news system for the Atari ST. Originally developed for OS-9, it has been ported to TOS independently by bjoern@drdhh.hanse.de and the author of this paper. MNews is slower then Mercury UUCP in processing incoming News but has less bugs and offers a more Unix like environment like an Unix compatible active File and a history mechanism. If you already use it, you will probably have had less trouble in installing NN since MNews supports and requires the HH standard, so lots of things mentioned above should already have existed.

However, to let NN cooperate with MNews, you still have to change on file: $USR\lib\nn\init. The init file in the distribution is prepared for operation with Mercury UUCP. Look at the init file and read the comments regarding MNews and HH rmail. Actually, you may run three different configurations:

Mercury UUCP for mail and News that was handled in section 5.2

Mercury UUCP for mail and MNews that is explained here

HH mail and MNews that is also explained here

NN offers a mail interface, which is less powerful then a real mail user agent like elm or blm, but let you read your mail or mail a message to the author of a newsgroup article. Therefore there are some configuration variables within nn, which let you adapt them to either mail package mentionend above. The variables are

mail # the location of your mail folder (HH mail)
mailer # the program to send mail to an author
append-signatur-mail # whether to append a signature file to
each outgoing mail or not

As has been said, NN is preconfigured both by compilation and the contents of the init file as delivered to use Mercury UUCP. If you are going to use HH mail (also called Digital Island UUCP), you may follow the comments within the init file to change the settings of these variables. The setting of `mail' makes no sense in Mercury UUCP, as Mercury does not collect your mail in one file, so it is unset by default. Also, the mailer program used by Mercury UUCP, mrecmail, appends the file $HOME\signatur.mai itself, so `append-signature-mail' is false (i.e., unset) by default. The changes for HH mail are

commented out, just remove the '#' signs in front of those set commands,
and put '#' in front of those regarding Mercury rmail. Note that
NN knows that the signature file for HH mail is $HOME\signatur.

Posting of news articles is controlled by the variables
`append-signature-post' and `inews'. The init file as delivered
sets them right for Mercury UUCP, and again you may change
that following the instructions in the comments.

5.4 Signature Files

Mercury UUCP, HH mail and MNews have a different naming convetion
for signature files. Mercury UUCP has two signature files, one
for mail, which should be in $HOME\signatur.mai and one for
news, which is called $HOME\signatur.net. If you are using
either HH mail or MNews or both, you need a $HOME\signatur
File, since both packages use this for your signature. You can
remove either signatur.mai (if you are using HH mail) or
signatur.net (if you are using MNews) or both then.

Note, that all three packages do not automatically put a
-- \n sequence in front of your signature so you should include
it in your signature file if you want to support this
(useful) convention.

After making the necessary modifications to adapt NN to the News and
Mail software you are actually using, the final installation step
is to initialise NN's database of news articles. Unlike most other
news readers, NN maintains a database containing all repeatedly
needed information about any article in any newsgroup of your system,
to avoid scanning newsgroup directories and reading articles more
often then necessary. This database has to be created and maintained
everytime new articles arrive at your system. See the NN manual
for a more elaborated description of NN's use of a database and
nnmaster, which is the database gardener.

Then run

nnmaster -I 100

This will initialise the nn database of available articles. nnmaster
reads your active file to determine which groups are currently on your
system. If new groups are created later on, nnmaster will append them
to its database during normal operation. (100 tells nnmaster to collect
at most 100 articles per group, which saves time during initialisation,
but won't let you read any older article then the youngest 100 in
every group. This disadvantage will vanish with time, as these old
articles get expired. You may safely omit the 100 or any other number,
but be prepared for a possibly very long initialisation run of nnmaster.)

nnmaster will prompt you to type OK (in uppercase letters!) to confirm
initialisation. Just do it. It will now take a bit of time depending
on how many groups already exists on your system. Be patient.

After nnmaster has finished you should have a human-readable file $USR\lib\nn\groups and a not human-readable file $USR\lib\nn\master. This is the root of the nn database. The groups file is editable, but before you are going to change it, read the corresponding sections in the nn manual. Later on I will tell you how to read this unusual formatted document using nn.

Finally, to complete the first time creation of the nn database, run nnmaster again, but this time you type

nnmaster -u

This will take even more time then nnmaster -I this time depending on the count of articles already on your system. You may want to take a break of sitting in front of your computer.

At least, don't worry about speed: only this first time scanning of the articles may take a considerable amount of time, later on the actual incoming news flow is handled very fast.

Testing nn

When nnmaster has completed this task too, you are ready to read news using nn. Just start nn by typing

nn

and watch what is happening. You pass through some welcome screens, and then nn will present you all articles of the first group on your system, either in an alphabetical sense or according to the sequence defined in $USR\lib\nn\init.

You may get help by typing ?, or :help or :man. The latter will put you into nn's online Manual, which you may read by pressing the percent sign % followed by the letter or digit standing in front of each entry on the screen.

The nn online manual is an ordinary text file (and lives in $USR\lib\nn\help\manual) and can be printed without problems. However, the text layout is somewhat unsual but I have no NN 6.4.11 Unix man page available.

You should read the NN manual. NN is a slightly complex, but very powerful news-reader and you will enjoy its features.

6. Posting Articles

There are several ways to post an article. If you want to make a follow-up to an article you are actually reading, just type 'f'. If you want to post an article without referencing another type ':post' from within nn, or 'nnpost' from the shell. NN will lead you through all necessary steps to create and send an article.

Note, that you can abort the creation of an article any time by pressing the `Delete' key (until you are within the text editor: leave it then

and press 'a<Return>' for abort afterwards).

Problems with posting, NN and the shell

Most people so far report few problems in making NN to present articles
to you, but much problems in making it to post something. The reason
for this is always, that another shell then Gemini/Mupfel is used.
Actually, most of the shell dependence is here.

For your help, I will outline now, how NN posts articles:

After asking some questions about newsgroups, distributions etc.
nn starts the programm $USR\lib\nn\aux.ttp. This program
makes heavily use of the shell feature offered by _shell_p
to perform its tasks. The first problem most people
encounter is that aux.ttp is not where it should be,
namely $USR\lib\nn\aux.ttp.

aux.ttp can perform five different tasks: mailing, replying, posting,
writing a followup and cancelling of articles. Which task it
should perform, NN tells him by an argument. NN says

```
aux mail
aux post
aux follow
aux reply
aux cancel
```

All other parameters needed are collected in a file $HOME\nn\param.mup.

When replying or posting a followup, aux first start your texteditor and
let you edit the original message to allow quoting. In case of posting
an original article, you are put into the editor too, but the file you
edit is almost empty.

Never remove one of the header field lines like 'Newsgroups:' or
'Subject:'. They are necessary and belong to the places you find them,
so do not even move them around or insert anything in front of them. If
you are using MicroEmacs or vi, the cursor is initially placed below them to
remind you of this.

After you have edit the message, the shell's tough job is started:
Now many files are moved around, appended, concatenated, filtered
and so on, and there is quite a good chance that you do not
have a good shell. Here are some examples of commands, your shell
must be able to perform:

```
echo "To: " > file
sed -e "s/^To:/X-To:/" -e "/^Orig-To:/d" filea >> fileb
```

Note the use of " characters here and the use IO redirection > and >>.
In the latter case output is appended to fileb. sed is not an builtin
command in most shells, but included in the distribution like grep,
which is also used by aux.

Some shells do not have a 'cat' command. Some have a 'copy'
command with the same meaning and an alias feature so you may
tell your shell

alias cat copy

Some shells do not like a space following the '>' or '>>'. Well, then
get another. They should allow it.

Some shells handle quoting in a different manner, they do not remove "
characters around arguments, do not collect them right, and so on. All
programms in the NN package uses the ARGV scheme as defined by Atari.
If your shell does not support it, you are in trouble. Again, get
another.

I recommend to use Gemini/Mupfel. It's shareware and costs 50 DM,
but it is worth more. If you are short of memory (1M or less),
you have to restrict yourself to use Mupfel alone, i.e., call
nn only within mupfel.

As far as I know, Gulam (Freeware) works well too. But there are
older versions of Gulam, which do not support ARGV. Make sure
you have the newest one (which nevertheless is pretty old).

Sometimes the reason for the failure of aux is repairable: check the
PATH environment variable, and look if all programs I mentioned in this
paper (the editor, sed, grep, cat, rm etc.) are callable by just typing
their name at the shell prompt.

7. Maintaining the nn database

Every time articles are coming to your site, either created
by you or forwarded to you by your newsfeed, nn's database
of articles needs an update. An update is also necessary
after article expiration.

This is easy. After your news system has processed the incoming
news, or you did expire articles, type

buildact
nnadmin EYW

in case you are using Mercury UUCP, or just

nnadmin EYW

in case you are using MNews, which maintains an Unix compatible
active file, so buildact is not necessary (won't even work
then).

If you are interested in how many new articles has arrived
after a poll, type

nnadmin L

finally. This will show you the tail of the Log file maintained
by nnmaster, and the lines starting with C: report about
collection of articles, how many have been collected during
one run and how long it takes.

Again, read the manual(s). They explain all these features and
a whole bunch of others.

8. Bugs and Bug reports

Yet, there is one bug in nn. The commands :unshar and :patch
won't work but bomb. If everything would be, like it was
intended by me, they won't crash, but still won't do
anything useful, as their use is very Unix specific. In case
you want to unshar a posted shar archive, or patch online
sources with a posted patch, use the save command to save
the relevant articles, and extract the shar archives or
patches by hand after leaving nn. The :decode command,
often useful in comp.sources.atari.st or comp.binaries.atari.st,
works and does not even require an external uudecode utility.

Anything else you consider a bug you may report to me via
E-Mail. Put the line

set bug-report-adress olaf@oski.toppoint.de

somewhere in your $USR\lib\nn\init file. Then bugs are
easily reported by typing

:bug

within nn. It is very useful for me if you type

nnadmin C >$USR\lib\nn\conf

to finish your nn installation. The conf file is automatically
included into the bug-report created by nn, and contains
useful information for me.

Also, always, I repeat, always, tell me about:

Operating system in use (TOS Version number, KAOS)
Type of computer (Mega, STE, TT)
Memory size
News/Mail Software in use
Shell used

since I do not have telepathic abilities.

If you think of any other special features of your computer not normally
found on other systems, include them in your description.

If the log file used by nn and nnmaster contains error reports, include
it in your mail. Keep the other lines around them, do not delete them
(i.e., do NOT type nnadmin LE >bugrep.txt). To shorten it just remove
all lines in front of the last nnmaster started line.

And, finally, do not expect wonders: the source code of NN has died during a hard disk crash (hardware failure). I'm therefore not able to remove bugs from the software, but may hunt for ways around them, or give you tips for changing your installation. Mostly, what you consider a bug is really an installation problem. On a couple of sites NN is working without problems for more than a half year.

9. Pecularities of the ST implementation

NN interprets the backslash as a path seperator under normal circumstances in contrast to its Unix father. But within the init file (both your personal init file and the global init file), the backslash is still used as an escape character, and if you want assign a TOS path to a variable, you have to escape the backslashes. Look at the definition of the variable `mail' or `newsrc' in the accompanying \usr\lib\nn\init file.

Furthermore, NN ST lacks the `nngoback' feature, as I did not write a programm which maintains a number of backups of the active file.

Also, NN ST does not have advanced terminal options like underlining or shading, as the ST does not have it.

If you are using gemini and run nn in the console window, you may define a environment variable TERM=gemini. NN then looks for the environment variables ROWS and COLUMNS (which are automatically created by Gemini), and adapts its screen size. This is also useful if you are using an enhanced video display on your Atari (then you have to create ROWS and COLUMNS in addition to TERM by yourself).

There is no background option in nnmaster, i.e. the option -r is ignored by nnmaster. Therefore, nnadmin always reports `master NOT running'. The 'W'akeup command of nnadmin is implemented as starting nnmaster without any option and, due to the nature of TOS, waiting until it has finished.

You may bother TOS with an uncareful setting of the save-counter variable. If this creates more then one '.' in the filename, TOS is very annoyed. Also, the $G variable is not useful in TOS, as it contains too much periods. The $F variable, however, is expanded right, i.e., it uses backslashes instead of slashes.

10. Technical Notes

Maybe you are writing your own news system. If you want to make it cooperate with NN, you may be interested in the HH standard. Just mail me and ask for it. Furthermore, NN understands a disk space saving feature, which is already used by at least my implementation of MNews. If a crossposting is coming to your site, Mercury UUCP creates copies of it in every directory, so a 10K article may easily occupy 30K disk space on your hard disk.

MNews uses a kind of `symbolic link', to prevent an article to be stored in more then one copy on your hard disk. In the first newsgroup

encountered in a crossposting the article is stored as a whole. This may be junk, but as this group must exist in every news system that is no problem. All other copies of the article does not contain its text, but a line reading

%(#)$ <path of original article relative to $NEWS or $USR\spool\news>

For example, if there is a crossposting to comp.os.minix and sub.os.minix in that order, and the article is stored in $NEWS\comp\os\minix\112 and $NEWS\sub\os\minix\20, the latter file will be very short and will contain only the line

%(#)$ comp\os\minix\112

Note that this causes a slight problem according to the manner % and $A are handled, when passed to shell commands. Both of them shall contain the full pathname of the file, the article is in. This may be a link file, in which case both % and $A do not contain the article itself. So, if you type

!cat %

you may be disappointed to see only a link entry instead of the article you have been actually reading. As long as I am usign NN, I never faced a situation where this bothered me, in fact I never used % or $A yet. If you really want to let a shell command operate on the contents of an article, no matter where it is, use the pipe feature of the save command or the print command.

Of course, if your news system does not have this feature, you won't have the problem (but probably want a bigger hard disk).

11. Acknowledgements

>the _external_ clock rate, as well as the external data bus width.
>(The MC68000 is not a 32 bit machine). NeXT and others do this also
>this way.

Hmm, I should think that if they were going all the way (as they
seem to be) it would be a needless crippling of the product to limit its
bus to anything but 32-bits. And as (I think - no one has given a really
in-depth spec. list yet) it is basically an accelerated proccessor, it should
only have to specify its bus speed as a) it doesn't handle anything but the
CPU bus and b) there aren't any components in the computer that can handle
above 16MHz anyway (memory cache aside). Of course, if it had an extended
series of VME slots, it would be cool. Especially if it were 32 bit VME.

So, would anyone mind posting specs on this beastie so we can do
less supposing, and more discussing (I know _I'm_ guilty :).

>Beside of this. Is it true that the ST-Magazin will present this
>as a instruction to do-it-yourself?

That would be nice - but we'd have to bulk-order the 68040s to make
it anywhere feasable. They are _expensive_. BTW, this overdriving of the
'040 could have some potentially nasty effects - I believe that Motorola has
only released 33MHz spec. chips.

> BTW, anyone know what the line-doubling graphics mode is?

Yes, someone knows: it is just a mechanism that displays each lines
twice so that
you have a 640x240 screen displayed as a 640x480 (it is just like an y zoom) !

On Multisync monitors, you're likely not to be able to display 640x240
cause it is
too slow for the monitor (or cause the image is not good: not enough
points used and
too many unused). The line-doubling permits to use the 640x240 on this
kind of
monitor (it can be useful for compatiblity or for memory reasons)

Who cares how "professional" a presentation show is done? Would
you have been more impressed if the Falcon had been presented by
Claudia Schiffer?? ;-)
Let's face it: The fuss they make is of absolute no use or harm
to any user once he/she bought the computer. It's the facts that
count. And for the Falcon that is: Excellent "multimedia"
capabilities and sufficient numbercrunching capabilities for the
money.

Unfortunately, I can see why new users would avoid Atari. I don't know how things are in Australia, but in the U.S., at least, Atari doesn't advertise. If I wasn't involed with BBS's run by Atari users who all told me how great the machines were, I probably wouldn't have gotten one myself. It would've been a BIG mistake, but one a lot of people are likely to make until Atari starts advertising!

1889. ST ftp sites

I have GCR 3.0 running on a TT, so I don't know if this applies to you,
but...
I found that I can only access Mac disks if I boot up with a disk in the
flopply drive (a light-off program doesn't help) and remove it before
running Spectre. Otherwise it will never take a floppy.

Maybe he did mean sensitive, at least in the sense of being susceptible
to noise. If we assume the D/A outputs 0 to 5V, 5V/65536 = 76 _micro_volts;
I'm not sure, but I'd think great care in construction and shielding
would be necessary to maintain those last few bits of precision...
(not saying anything one way or th'other in re Falcon)

Strictly speaking, direct-to-disk recording doesn't even require D/A
conversion, so this whole discussion is kinda pointless :^)
Seriously, though, in addition to a big disk, you'll need a good
(==expensive?) sound digitizer (I don't recall reading that the
Falcon has 16-bit A/D on board...)

>flicker which is a shame.

Was this on a SC1224 monitor or were you seeing flicker on a Multisync?
BTW, anyone know what the line-doubling graphics mode is?

> But I guess with 640x480 2356 colour at least
>we're now up to Mac and PC standard. The sound system was very good
>though, I don't use my ST for music but the sound coming from the

>
>I guess everyone knows that the GEM interface has gone '3-D', i.e 3D borders
>on windows and 3D buttons just like Windows. Unfortunately they didn't
>seem to be showing MultiTOS, at least on the general display models.

This is nice, but seeing as how soon MT should be out, I doubt if
TOS 2.07 (still haven't figured out why it isn't 3.07) will get high sales
volume. BTW, anyone know if it has the CTS/RTS bug? Will MT incorporate the
3-D look of 2.07?

>I did notice some other companies showing what I think was MultiTOS
>(it wasn't MultiGEM).

This was probably just (ha!) MiNT. Shouldn't look or act much
different when MT comes out - except multiple GEM windows...

> What was nice to see was the lower price for a
>base model of the TT at 2000DM (this wasn't a special show price either).
>And Atari didn't show any STEs.

Excellent. The question now is, how much are TT video (24bit) cards
running for? Oh, does anyone know what the max resolution of the PTC(TT color
monitor) are? 640x480, or will it do 800x600?

A couple months ago, someone posted a list of TT/MSTe video cards that
are available. Would someone mind posting an updated list? I would prefer
prices in US$, but not neccessary if fairly recent exchange rates are posted
too (hey, I have a calculator! :). Would it be asking to much to include a
(US) vendor for the prices quoted?

1897. Re: Atari ST with 60Mhz 68040 on the Atari Messe

Newsgroup: comp.sys.atari.st
Date: 1992-08-25 21:17:58 UTC
From: tiemann@iis.ethz.ch
Message-ID: <tiemann.714777478@tardis61>
Source record: 218353

I also saw this thing at the 'atari messe' and talked some words
with the person who has built it.

In my eyes it's not fair to sell this system as a '60 MHz 68040'.
Maybe 60 MHz is the internal clock speed. But one has to specify
the _external_ clock rate, as well as the external data bus width.
(The MC68000 is not a 32 bit machine). NeXT and others do this also
this way.

Beside of this. Is it true that the ST-Magazin will present this
as a instruction to do-it-yourself?

Bjoern (tiemann@iis.ethz.ch)

(also waiting for the Falcon 040)

1898. Icon-Editor

Newsgroup: comp.sys.atari.st

Source record: 218362

Does anyone know where I can get an application for editing the
DESKICON.RSC files (the icons) in TOS 2.?+

I'm using a ReSourCe editor at the moment - but it is very slow, and
very awkward to use - and every time I save the file, I have to delete
the definition files it creates.

ICONEDIT.APP is mentioned in the DESKICON.RSC as one of the icon names
- and if it does the job, I'd like to get a copy from somewhere!!

a>But memory is the big problem - Atari aren't using SIMMs for size
a>reasons - so how much are upgrades going to cost? And how fast can third
a>party sources get them out?

On the Falcon RAM-Cards only RAM-Chips are located, the memory controller is placed on the board. So there should be no real problem for any third party company to build their own memory expansions for the Falcon.

>Seriously, though, in addition to a big disk, you'll need a good
>(==expensive?) sound digitizer (I don't recall reading that the
>Falcon has 16-bit A/D on board...)

There definitely is a microphone jack at the back of the Falcon.
It's in the Falcon sheet that was available at the Atari Messe
and I saw it myself too. An Atari representative explained to me
that all you need to digitize sound was a microphone to plug into
that jack and some software. Unfortunately, I didn't ask about
technical details, but from what I heard I conclude there must be
an A/D converter of some sort already built in.

> Wouldn't cd player hardware have a fixed rate of 41khz (or is it 44)?

(44KHz). Nah, (just about) the only useful component from a CD player would be the D/A and the oversampling/MASH hardware. None of that is sample rate dependant (other than spec. min/maxs).

>> Besides, I get the feeling from reading the origonal post that he will

Yes, and yes, but I believe the original poster goofed by putting "professional" in his post, and got jumped on. I guess "near professional" would be more accurate (and being subject to interpretation, he wouldn't be labled wrong out of hand). I am still a little fuzzy on his "real-world" resolution. I mean, since when is a studio a real world anyway (or a home studio for that matter). If he is talking about how well it deals with interference... well, unless you are in a nice, insulated studio, the mics will pick up noise, and of course cables can be very antenna like...I should think that noize generated by your A/D connector would be rather minimal

(unless of course it is a really bad/cheap A/D that produces noize on
the input line). However, since I am hardly a music studio tech., these
are merely the ramblings of a frustrated EE student (almost grad).

1906. Re: Falcon question: is 640x480x8 mode memory-mapped?

Newsgroup: comp.sys.atari.st
Date: 1992-08-25 23:32:23 UTC
From: Mark Kovarski <kovarski@zooid.guild.org>
Message-ID: <1992Aug25.233223.28484@zooid.guild.org>
Source record: 218379

The Falcon030, as a machine, has some very unique features to offer. As far as the company is concerned, it is run by very unprofessional staff members, to say the least. Not only that, they are *very* affraid if someone voices an opinion that does not correspond to theirs.

As I have stated many times before, the computer market in North America and around the world has changed dramatically over the course of the last few years. This is not 1985 but 1992. The PC market along with the Mac market are the dominating force and will remain so unless something truly spectacular will happen. The amount of Atari dealers that are still supporting the Atari line of computers in North America is declining. Only a very few are still selling Atari computers. There is vitually no support, and if there is you will have to search for mail-order house. Not many people like to use mail-order houses, I can tell you that much.

For whatever reason people are switching to other platforms, they are doing it because they are not satisfied with the current one they own. After contributing to the Atari community as much as I possibly could, I have decided to move on but I still own lots of Atari equipment. Currently I am running a 486/50 MHz, 16 MB Ram, ATI Graphics Ultra (Super Fast Graphics), 17 inch MAG Monitor etc. Sure the system costs quite a few $$ but it was well worth it. Runnnig IBM's OS/2 2.0 allows me to multitask and multithread and run Windows and DOS as well OS/2 programs at the same time. I must agree, when Atari Corporation initially released their ST line, PC computers could not compete but today it is a totally different story. You can have the fastest machine in the world but if there is almost no support it's not worth one dime.

Forbes, a leading financial publication in the United States, summarized Atari Corporations dealings very nicely - CHEAP DIDN'T SELL.

I'm pretty sure this is EVERYTHING that is required to set-up GCC/G++...

/atari/gnustuff/tos/curses/crsolb12.zoo
/atari/gnustuff/tos/g++/gpincl07.zoo
/atari/gnustuff/tos/g++/gplibo07.zoo
/atari/gnustuff/tos/g++/gplibs07.zoo
/atari/gnustuff/tos/g++/gplibt02.zoo
/atari/gnustuff/tos/gcc/gcc21b02.zoo
/atari/gnustuff/tos/gcc/gcc21dvi.zoo
/atari/gnustuff/tos/gcc/gcc21man.zoo
/atari/gnustuff/tos/gcc/gccdoc.zoo
/atari/gnustuff/tos/gemlib/gmlibo23.zoo
/atari/gnustuff/tos/gnulib/libolb80.zoo
/atari/gnustuff/tos/gprof/gpfbin07.zoo
/atari/gnustuff/tos/include/includ80.zoo
/atari/gnustuff/tos/pmathlib/pmlolb18.zoo
/atari/gnustuff/tos/util/utlbin27.zoo
/atari/new/crt0fils.zoo

Note: the file "/atari/new/crt0fils.zoo" can only be gotten by changing into
the /atari/new directory, and getting the file - you cannot list the files
in that directory, but you can get them (now you know the name).

Can anyone add to the above list?

Well, that is ALWAYS being done. The recent MACWORLD had an article where the author commented how Apple's CEO talks about Apple computers understanding human speech, as if Keyboards will be obsolete real soon now. The author commented that such talk is fair nonsense, we don't have that sort of technology just yet. My point is, Atari isn't the only people who talk about futuristic visions as if they were going to be realities next week.
That aside, the rest of your commentary seems pretty valid.

>Neither archimede users nor Next nor Mac users...
>So, Atari users ? Yes, and even not all...

Is this guy for real? Does he think everyone in the world already owns
a computer and so it is a competition between the various computer camps?

Get real.

Companies survive by creating NEW customers - not by dragging customers from
other vendors.

I don't see why a new-computer buyer would avoid the Falcon - or any Atari
products. Certainly a PC is useless to the new user - way to difficult to
operate (it's okay for us to say "Oh, just press return", but take a look
at the average new-user - I have, and they HATE IBM PC's). Apple computers
are great for new users - but $$$'s are always on the new-buyers mind, since
that is about the only thing they are familiar with that they can compare
(Computer A is cheaper than computer C, so buy A).

"Power without the Price" is good.

1916. pointer and addendum to Info-ZIP ANNOUNCEMENT

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 00:34:50 UTC
From: roe2@ellis.uchicago.edu
Message-ID: <1992Aug26.003450.6704@midway.uchicago.edu>
Source record: 218380
Cross-posted to: comp.binaries.ibm.pc.archives,comp.binaries.ibm.pc.d,comp.sys.mac.apps,comp.sys.3b1,comp.sys.amiga,comp.sys.atari.st,vmsnet.sources.d,alt.binaries.pictures.utilities

This is a pointer to Info-ZIP's announcement of its latest file compression/encryption software. The announcement is in comp.sources.d with the following subject line:
REAL ANNOUNCEMENT: Info-ZIP Zip 1.9, UnZip v5.0, and utilities
and it contains some important information about the release. (And yes, this message is appropriate to all the groups to which it's being cross-posted; follow-ups to comp.sources.d or to the group in which you are reading this, please.)

The following is an addendum to the announcement:

(1) I haven't yet seen either WizUnZip or the encryption/decryption sources yet, but they should be out soon. There were last-minute changes to the WizUnZip documentation files, and the crypt stuff must be posted from outside the US.

(2) Timo Salmi and Arjan de Vet reported at least one and possibly two bugs involving zip's -l (convert end-of-line) option. It truncates files greater than 64K (patch will be posted to c.s.m soon), and in combination with -j (junk paths) and a full path specification, there may be another bug (not reproduced yet).

(3) Charles Hannum reported a bug involving zip's -m option (move files into zipfile) wherein there are "dangling directories" or some such when zipping as root on an IBM RS/6000 AIX system. We don't have any more details on this yet; I assume he means that zip isn't removing directories after itself when it stores files recursively.

(4) Several people have contacted us recently about porting both Zip and UnZip to the Amiga; the UnZip port appears to be finished (not tested yet, though), and the Zip port is claimed to be almost done. So please contact zip-bugs@cs.ucla.edu before doing it all again, and we'll put you in contact with the others.

(5) The Summary line of the announcement should read "comp.sources.misc", not "comp.source.misc".

(6) The utilities to which the announcement refers are, in addition to Zip and UnZip themselves, the following: ZipNote (add/edit zipfile comment or individual file comments); ZipSplit (split a large zipfile into smaller pieces); ZipInfo (detailed information about zipfile structure); FUnZip (simple Unix filter version of UnZip, most useful in conjunction with tar); and ZipCloak (stand-alone zipfile encryption/

decryption program).

Finally, to repeat something from the announcement: archive sites are still in the process of getting all the pieces of the release, so WAIT A FEW DAYS if the files aren't there yet! Just keep telling yourself, "patience IS a virtue." :-)

Greg Roelofs
Info-ZIP guy

>Atari products are concerned.

It might use Interlace.... and you are excited about it?

Yuck! That sounds like a nasty form of torture, or perhaps it will
be like those products you buy to kick the smoking habit, only this one will
kick the video game habit. You see, these great games will come out for it
with awsome sound and kick-butt graphics, but everytime you play the game, it
gives you this splitting headache. Since everything eles would be nothing
compared to it, and since you wouldn't be able to stand playing the Jaguar,
you'd eventually kick the habit, go blind, or go nuts.

1918. need help with emacs & mint...

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 01:50:48 UTC
From: kendall@flammulated.rice.edu
Message-ID: <KENDALL.92Aug25195048@flammulated.rice.edu>
Source record: 218372

I've having a problem with emacs 18.57 and mint .095 (the newest one) on a new 1040STE. The Emacs is the one from the mint directory on a.a, as is Mint itself.

Here's the problem - I can't get the arrow keys to work with Emacs - whenever I press an arrow key, Emacs only gets one character of the escape sequence - the first keypress sends a ^[, any other keypress after sends the following letter ('a' if I was using the up arrow, for instance) and then the key pressed as well. I have my TERM, TERMCAP and everything else set OK - I can use Emacs, it's just that the arrow keys don't work, and also presumabley anything else that needs a multiple character escape sequence to work. Any ideas would be most appreciated...

Thanks,

--

Hi all,

I have a TT w/ TOS 3.01. I am trying to unzoo a file by typing:

(click on zoo.ttp) "-extract zoo21bin.zoo"
or
"-extract zoo21bin.zoo *.*"

and it is dying with two bombs. I also tried a beta zooshell (don't
remmember who wrote it) and it bombs too. Actually, it says "fiz.ttp - "
and then it bombs.

So anyone know what is wrong, and more importantly, how I can get
zoo working. I really wanna use that serialfx and tcsh!

ADVthanksANCE!

>I wait until MT is included before I buy the Falcon.

Strange.
To me an atari rep said that they hoped to ship the falcon directly with
multitos. He was not 100 % sure if they could make it though.
In the falcon multitos is partly in rom and partly disk based.
The TT multitos will be a fully disk based.
(still according to this atari person).

>
A few reasons why some current devices cost several thousands:
a) They contain the software to control the sampling, playback etc and
to allow sample editing... The Falcon does not.
b) Such devices contain High Quality ADCs and DACs. Do you know what
the quality of the Falcon's converters are? As a musician, I thought
you might realise that just because a spec sheet says 50kHz 16bit or
whatever, this does NOT necessarily mean CD quality; look how much the
sound of CD players has improved since their introduction, still with
the same digital data. (Anyway my not-very-expensive CD is
18bit 176kHz on output anyway, by oversampling). The 56K chip is
going to have its work cut out if it is performing oversampling,
digital effects and EQ, real-time editing etc as available on
the expensive equipment.

I do expect the Falcon to become the basis of some reasonably priced recording
systems, but I do not think that, without extra hardware, I do not think that
it will compete with the $15000 Pro systems you mention.

David.

This got mungled, I ended up putting in a double negative, but I'm sure you
know what I meant! The audio on the Falcon will almost certainly not compare
with the quality of the Pro systems that the original poster mentioned.

Shameless irrelevent plug: Anyone in Reading for the rock festival this
weekend might like to check out Blank Generation at the Greyhound, Silver
Street on Thursday (official Festival starts Friday). But don't expect my ST
to make an appearance, it doesn't drink enough to play in the Blanks...

>are merely the ramblings of a frustrated EE student (almost grad).

In the "real world" you are very lucky if you can get 14 bits of real
resolution, the noise levels, even on the highest quality A/Ds and filters,
are too high.

>
>>>>(Also, when you get a Falcon, take a look at the audio out system. I
>>>>bet you it's not anywhere near as noise-free as the out of an AKAI
>>>>sampler.)
>

I can't really comment on this, and neither can you, until you put the same
data through both systems and check it with a spectral analyser.

Just because the AKAI system is from a big company and costs a large amount
of money doesn't mean that it's the best you can get, often the best kit
comes from small innovatory companies and doesn't cost a large fortune.

Steve

PS. I am not saying that the Falcon IS better than the AKAI system. I'm just
saying don't prejudge just on the price!

PPS. Even if the built in A/Ds aren't good, what's to stop you bolting some
onto the back of the DSP? In the realms of digital Data Acquisition, the
Falcon is quite a formidible system, 8 channels at 50KHz adds up to a total
sampling rate of 400KHz! An Analogics 400KHz 16bit A/D with 8 channels (VME
bsu based) will set you back something in the region of 10 thousand pounds
stirling (ex VAT). A PC system of the same sort of ability will cost you
about the same or more.

>monitor) are? 640x480, or will it do 800x600?
>

I think the PTC can go upto 800x600, but it's not a very good monitor.
My PTC flickers a lot (been replaced soon) which I thought was just
me, but even the Atari PTCs at the show were fickering - dark lines
running down the screen. Unfortunately the TT/MSTe graphics boards are still
in the 800-900DM range. What I'm thinking of doing now if to go for the
large mono monitor which is only 600 pounds and should be great for
C dev work.

Many people are mailing to say Gemulator is FRAUD if demo video is showing progrmas running from 100% RAMDISK and people think Gemulator is faster than real! Post inspectors will investigate if FRAUD possible and put crooks in salt mine?

None of Gemulators ads telling of 40% speed with 386 so people will want MONEYBACK GUARANTY if something like worldclass MIDI software does not work or is slow like glue.

Regular price of Gemulator is almost SAME PRICE as new $799 Falcons so BraSoft (Bra__Soft? BrainSoft?!) MUST give moneyback guaranty to prove it is good!

1933. OS/2 HPS and Atari file format

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 11:18:12 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Aug26.111812.17058@sactoh0.sac.ca.us>
Source record: 218397

Thanks for the traffic about OS/2 and TOS, here is another.

Now that OS/2 can name files with more than eight characters with it's HPS, what does that do to the ability for Atari to read IBM format disks?

I'm sure that IBM machine will be able to read Atari files (under the old filename system) could an Atari read files created under OS/2's high performance filesystem?

Would compatibility with the OS/2 file format be a future feature of a TOS 4?

I feel this to be an important question, as OS/2 becomes more popular, and the likelyhood of Windows NT having a similar filesystem, and the need for curent and future (?) Atari users to read IBM disks.

1934. Atari 1040 STe system forsale

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 12:48:52 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <swood.714833332@vela>
Source record: 218395

Atari 1040 STe with 4 Meg internal ram for sale
system includes:
320x200 512 color graphics or high resolution 640x400 mono
Stereo sound, parallel & serial ports, DMA port
monitor & RF outputs
Internal DS/DD 800K 3 1/2" floppy drive
External SF 354 SS/DD 400K 3 1/2" floppy drive
up to four joysticks (mouse and 2 joysticks included)
Analog amber monitor and cable
RF converter and cable for connecting to any TV
small desk stand for monitor and mouse pad

books included - almost complete set of abacus atari books and
some miscillaneous compute, etc books

Ton's of PD software and disk case plus the following commercial:

LDW Power Spreadsheet (VP Planner clone - Lotus compatible)
DbMan (Database III+ clone)

Flight Simulator II
Mig 29 Fulcrum
Super Conductor

plus about 50 disks full of spectrum adult graphics files

Asking $550 or best for the system

swood

(313) 801-0586 (313) 394-0351 or email swood@vela.acs.oakland.edu

> that is about the only thing they are familiar with that they can compare
> (Computer A is cheaper than computer C, so buy A).
> "Power without the Price" is good.

The only trouble with this is that it assumes equal marketing - that the new buyer is AWARE that A exists and is cheaper than C. If all he or she knows about is C, that is what will be purchased. If the buyer thinks that A doesn't have software, or support, or any of a million things a new user thinks are important (and they think some odd things are important), they'll buy C.

You can have the best product in the world, at the lowest cost (gee, I seem to recall a computer that fit that description...), but if you don't market it, and FLOOD the public awareness, you will never sell anything.

Yes, ads in magazines like Time, Newsweek, People, Good Housekeeping, etc. and on national network television (or MTV, CNN, etc.), are expensive. But not advertising is FAR more expensive. And sadly, that's the path Atari's taken for the past seven years.

Much as I love using the ST, and I am seriously considering the Falcon, I won't buy it if Atari doesn't proselytize to the unwashed masses. I'd rather go with one of the goyim computers in that case.

Could anyone (who knows) comment on the 3D look to this newer TOS/GEM
? Any posibility that it will work with a Mega STe (I'm assuming
MultiTos won't be available fro an STe) ? I haven't gotten 2.06 yet
for my Mega STe so if I can get a 3D style I'd love to.....

Also, what kind of monitor do you need for the 3D effect ?

Lastly, Where can I find that list of monitors/video cards for Mega
STe's ? My SM124 (1986 vintage) is finally starting to show its age
(and I can't stand to use my SM1224 for anything other than games)...

Thanx....

> direct-to-disk recording system.

Lemme get this straight: It's not as good as high-end SAMPLERS, so you can't use it as an AUDIO RECORDER?

Apples and oranges, Dave. Neither DAT machines, nor ADAT recorders, or the ubiquitous Fostex 16-tk 1" analog used on every rap record, nor just about every other device used daily to make professional recordings boasts the same type of output as high-end samplers. You're making a really bizarre conclusion, here.

> Practically speaking, 50 kHz is no better than 48 kHz anyway, since
> Nyquist's theorem tells us that to sample any frequency with absolute
> accuracy you must sample at double that frequency. 50 kHz vs. 48 kHz

> sounds. 24 kHz is well beyond the average human being's hearing
> range.

It matters in terms of sample quantization errors and the amount of aliasing you end up having to filter out, but I won't bore you and everyone else with musicianspeak. Agreed that the difference is minor.

> >> (Also, when you get a Falcon, take a look at the audio out system. I

> most of the music magazines) the industry standard. It sounded great
> to me. If you think a $1000 AKAI sampler isn't good enough for you,
> you can forget the Falcon's audio system right now.

I mean this in the kindest possible way, Dave, but I don't really think you know what you're talking about.

First of all, there is no Akai S9000. You might be thinking of the Akai S900, which was an industry standard about four years ago (how old are your music magazines) and is now quite obsolete.

Second, if it sounded "great" to you, I don't think you're ready to judge the requirements of professional audio. The S900 is one of the noisiest, grainiest samplers still in use.

Third, the S1000 goes for about $7000, not $1000. You wont find a single pro sampler that can be bought new for $1000.

And fourth, how many times do you have to be told that samplers and recorders are completely different? A sampler's DAC involves things like moving anti-aliasing filters and variable-frequency playback. An audio recorder can make do with fixed-frequency playback and simple D/A conversion.

> Do you think Atari (a faltering computer company) could do better than
> AKAI (a successful and well-respected music company) with a 20th of the
> budget?

If you want to compare Akai's ill-fated recorder to the first wave of Falcon-based recorders, I think you'll be surprised (even though one is tape-based, a comparison can be made).

> The point is that the sound quality you'll get out of a Falcon hardly
> compares to what you'd get out of high-end (or even low-end) samplers.

You still don't get it, do you? Look, if you really do know the difference between samplers and pro audio recorders, then stop using samplers as your ideal. Compare it to the S/N specs and D/A conversion of, say, Hybrid Arts' Digital Master system. Or Cubase Audio. Or something in the same ballpark.

> Given that, I *hardly* think you'd want to use the Falcon for serious
> direct to disk (multitracked or otherwise) digital recording. Not to
> mention the fact that you'll need to buy a pretty big hard disk to go
> along with your Falcon if you want to do direct-to-disk recording. That
> adds a couple thousand right there (for a 1 gig drive, for example).

What have you got against a Syquest 44meg removeable system? For adding vocals to MIDI, it'd work fine. Buy one for $600, and plug it into your SCSI port.

But yes, you'll need a large hard disk for many applications. Just like you would with any other direct-to-disk recorder on any other computer. What's your point?

> The original claim I responded to was (essentially) "the Falcon will
> revolutionize the music business because it will allow anyone to do
> professional direct-to-disk recording for very little money." The
> Falcon may be a nice machine, but it's not *that* nice.

It doesn't have to be "*that* nice." To fulfill the goal, it will have to have good software, decent (relatively cheap) D/A conversion, and easy hard disk expandability. Knowing C-Lab's and Steinberg's attitudes towards the Falcon, the specs on the DAC, and the basic functioning of SCSI, clearly there's no cause for concluding the machine is incapable of performing one of its primary functions as a musician's computer.

Yes, there is apparently a stereo microphone input. But earlier in this
thread we were talking about Pro standard multitrace direct-to-disk, requiring
a) More than two channels of ADC
b) Ability to cope with a wider source range than just microphones
c) Higher quality converters than are likely to be fitted by Atari, taking
into account price of the machine and their past history.
d) A greater selection of sampling rates than the four used on the STE; we
definately need 44.1 and 48kHz. Does anyone know if the Falcon allow
such rates?

>you'd eventually kick the habit, go blind, or go nuts.

I would say: It depends. If you use interlaced graphics to display, say,
a word processor's text and take advantage of the improved detail, it
will flicker badly.

If you, on the other hand, use interlaced video to display computer
game screens with smooth shading between adjacent screen lines, you
won't notice the flicker any more than while watching TV.

Generally, the flicker in interlaced video modes is noticeable only
when bright and dark screen lines are displayed next to each other, only
then the low frame rate becomes obvious.

1944. Printing PostScript from Timeworks DTP

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 15:23:18 UTC
From: rahin@scs.leeds.ac.uk
Message-ID: <1992Aug26.152318.21836@lut.ac.uk>
Source record: 218259

This probably have been discussed before, but I am having difficulty. Would appreciate if someonce could provide the right answer.

I am plotting some graphs & then saving those as GEM files with OPUS. These GEM files are then imported into Timeworks DTP. Timeworks is set for a PostScript printer. I print to a disk and bring the disk to my school. When I try to view the postscript file using ghostscript I get the following message "Error: /undefined in statusdict" followed by various stack stats. I then removed the ^Ds from the beginning & end of the PS file. gs now shows the file on the screen. However, only the text part is shown and no graph lines, including axes are shown. I tried to send the file to a postscript laser printer. The printer is a Apple Laser Writer and connected to the school SUN network. When I took the printout, it is full of PostScript source. Obviously, PS was not interpreted by the printer. What is wrong here ? Is some header portion missing ? Do I need to put some header info into PS file ? Suggestions are welcome. Timeworks is V.1.12 (I think).

Thanks in advance.

>The correct termcap entry for tw52 is the one put into the TERMCAP=
>environment variable by TOSWIN. You can also retrieve it by sending
>ESC T to TOSWIN from one of the windows.

If I open a TOSWIN window with MINTSHEL running inside, 'echo ESC-T' bombs out
the shell; I finally tried it on a minimal system; nevertheless the
problem didn't disappear:

This is a MEGA-ST1 with (German) TOS1.4.
I prepared a disk with only the following files on it:

AUTO\MINT.PRG
TOSWIN.ACC
TOSWIN.RSC
MINTSHEL.TTP

After system startup, open TOSWIN, create a std window with MINTSHEL in
it (no args) and enter 'echo ESC-T'.
In response, I get something like
pid 3 (MINTSHEL): BUS ERROR: PC=456205c (basepage=759d0)
The TERMCAP string gets printed, then MINTSHEL exits.

>>the address/phone listed below.
>
> I hadn't heard about this product. Does it check in memory for already
>resident viri? Does it scan a hard-disk for file-infecting viri (as opposed to
>strictly boot-sector viri)?
>
> Does it scan the boot-sector of an HD?

Yes, Ultimate Virus Killer(UVK) scans memory for all known existing resident
virus strains and provides probability factors on unknown code resident in
system vectors. It can scan any disk(hard or floppy) for all known link
viruses(the kind that attach themselves to files) and scans both hard and
floppy boot sectors for viruses.

Recognizes and protects against every known ST virus both bootsector and
link strains, can immunize disks against future virus attack. Over 1000
benign executable explicitly recognized with over 500 being directly
repairable from the program(great to restore functionality to the trashed
boot sector on that new game). Can detect unkown strains of viruses and
give a viral probability factor on discovery.

UVK(introductory retail $29.95) and Diamond Edge(disk diagnostics/repair/
optimization/data recovery) will both be released at the Glendale show on
September 12, 1992. We are taking orders for both products now at the
address listed below(Visa/MC accepted).

If I can be of any further assistance please let me know.

1947. FontGDOS WORKS!!!

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 16:04:53 UTC
From: dbsuthe@pbhya.PacBell.COM
Message-ID: <1992Aug26.160453.9574@pbhya.PacBell.COM>
Source record: 218252

08/26/92

I almost missed an excellent addition to my ST due to a lot of flames. That addition is Font GDOS. I had ignored it's existance because of numerous messages in this newgroup that said how terrible it is.

Last night I downloaded it from GEnie (on a lark) and found that it works GREAT with ALL of my GDOS compatible programs. I can't vouch for all of the printer drivers, but the laserjet driver even worked with my old versions of GDOS. It's the first one that does work with all of my programs without quirks.

There is a help file on GEnie that provides helpful hints. It's not real long and I suggest you read it. It notes that there was (evidently) another version uploaded at one time. This (current) one is about 450K and includes quite a few printer drivers, FontGDOS, configuration modules (Xcontrol and accesory versions) and documentation.

Now before we hear from those for whom it did not work, here's a setup that does work:
4 meg 1040 STe
TOS 2.06
HP Laserjet II (2.5 meg)
Mega44 hard drive.
Golden Image scanner
Navarone clock.
Warp9
Xcontrol.acc
AHDI5.0
And the programs that worked with it:
Touch-up
Timeworks Desktop Publisher
STraight-FAX
EZ-Draw
Degas-Elite

I am using the standard Timeworks DTP bitmapped fonts, and they work fine.

Thank you, Atari, for releasing it as freeware. It makes my whole system much more usable. Now how about a quick note concerning the policy that it ONLY be available from GEnie? (I can think of several good reasons, but I would like Atari's)

In rgb mode it should work fine, though you might need to use resistors to lower the output from the Atari, as I know that was needed with Sony rgb tv's. There was a file around descibing how to hook up Sony SCART connectors, that had a pi3 picture. I don't remember the name, but I know it's on GEnie, if not on atari.archive.

>Guess what regular TV uses...? Oh no..! Interlace..!!

Oh no! My mother lied to me all those years! She said my headaches
were from the stupid shows I was watching, and that it was sucking my brain
out through my eyeballs! I was such a child to believe her. :)

To be honest, I don't watch TV that much, and when I do, it does give
me headaches. However, I would think that better TVs reduce the more harmful
effects of an interlaced screen (aside from ELF and whatever other radiation
that TVs spit out). Isn't there a signal buffering on most (good) TVs so that
they can display the picture at that magick 60 Hz (is it 50Hz across the
pond)? If not, it may just be a difference in phosophor, or more likely the
fact that I generally do not strain to look at a TV as I do not do DTP, etc
on a TV, where fine resolution would be neccessary.

>(Not that I believe for a second that there's anything like an
>Atari Jaguar in my immediate future to threaten me with splitting
>headaches or anything else...)

Yeah, I suppose they would have to sell it before we could go home and
get our RDA of head-pain. So we will have to make do with getting our RDA
from the office monitors, or if you can't do that (they installed glare-guards
on all the monitors - How DARE they?) you can always try looking at the sun
and seeing how long it takes the "sun ghost" to go away.

For the (sick) humor impared: :)!

1950. Falcon DSP -> standard modem & fax?

Newsgroup: comp.sys.atari.st
Date: 1992-08-26 17:04:29 UTC
From: selick@csa.bu.edu
Message-ID: <94611@bu.edu>
Source record: 218257

Just how programmable will the dsp chip in the new Falcon be? For instance, could one program it to emulate a standard modem? How fast would it be able to run? How about using the Falcon as a midi sampler? What polyphony would such a beast have? Perhaps a vocodor? It would seem that somebody who was a bit clever could even make the Falcon into a Yamaha DX-7, or even a more complicated machine, using MIDI as the key input. Could the dsp chip possibly be used for added processing power if you are using non-dsp programs? Any chance C-Lab's Notator will be taking advantage of the new falcon hardware in the near future? When they say "8 channel digital recording" Do they literally mean like an alesis adat machine? Will future programs be able to do digital cut and paste on one of those tracks independantly? How large a disk drive would one need for say 1 minute of 8 track recording? Would it be possible to do such recording directly to a tape backup drive? Can the Falcon start up an old car on a frosty morning? :)

Lots of questions here...feel free to answer just a few!

-Steve <selick@csa.bu.edu>

More likely the 040 is running at 30MHz externally and 60MHz internally.
Intel is using this scam in their 50MHz 486DX2 chips and it sounds like
this same trick is being used by the company whose product you saw.
Don`t worry though, the 040 is faster at any clock speed than the 486
and such deceptions really are not needed. However, they may be running
a 25MHz chip at 30MHz and there could be problems.

If you install new fonts for TW, then I believe that you have to re-run
'FONTWID.APP'. However, as I have never done it before, I cannot be sure.

Best of luck,
Robert.

Source record: 218274

As far as running 68040s at higher than rated clock speeds, we use 25 MHz 68040s and FORCE has glued industrial strength heat sinks directly onto the 68040 chips because these suckers run hot at 25 MHz. Now this 60 MHz thing is from Germany, right? And I understand that it can get pretty cold in Deutschland, so maybe the heat produced by the chip will be of more benefit than it would be here in sunny So Cal :-)

So, Thomas (or anyone), what do you think about the Falcon's capabililities strictly as a sampler? This is what intrigues me the most (as opposed to direct-to-disk recording), since my music is entirely electronic. Do you think the components are "up to snuff" for pro-quality (ambiguous term, I know) sampling? How might the sound differ from, say an Emax II ?

I'd love to see the Falcon equipped with appropriate software for the DSP, to emulate something like the Kurzweil K2000, where you take a sample and mutate it beyond mortal recognition.

Yes, MNP4 is error correction (actually its faster than MNP5 which is error
correction + compression). From tests I've done it appears to do about 210cps
with g-protocol and 250 cps with e-protocol (but I've only used e-protocol
once)

>68040 CPU running at 60 (= sixty!) MHz.

This is an overdriven chip. Motorola only guarantees it operates at
a frequency of 33MHz. You can push them at higher frequencies iff a) the
particular chip you have can take it (not all chips can be pushed) b) you use
one mother big heat sink to deal with the extra power that needs to be
dissapated. The problem with overdriving your chip is that it may work when
you first get it, and it may work during a "burn-in" test to see if the chip
works, but because of the extra heat you can have damage creep into the chip
until it is eventually unusable.

However, it is NOT like the DX2 chips by INTEL (as one of the other
posters had mentioned). The DX2 are rated to go at the doubled speed, and
yes they have an external speed of half the internal speed, but if you have
a decent internal cache, you still see signifcant speed increases (much larger
than the early ST accelerators that only accellerated the CPU without
accelerating the memory it accesses).

The Motorola DSP56001 has its own port with which it can communicate directly.
This actually provides two serial ports, one synchronous, the other
asynchronous. The port uses a femal DB-15 connector, numbered like this

```
8 7 6 5 4 3 2 1
0 0 0 0 0 0 0 0
0 0 0 0 0 0 0
15 14 13 12 11 10 9
```

1 Serial clock signal (synchronous)
2 Serial receive data (synchronous)
3 Serial transmit data (synchronous)
4 Serial clock signal (asynchronous)
5 Receive data (asynchronous)
6 Transmit data (asynchronous)
7 +12v
8 -12v
9 Ground
10 Ground
11 Ground
12 SC2

13 SC1
14 Reserved
15 Ground

There's two that I know of. NewDesk Icon Editor from Software Development Systems (SDS). It runs as a CPX. Latest version is 2.xx. Very nice. There's also the Icon Juggler (I think that's the name) from Codehead Technologies. They ship it free when you buy the ROMs or the TEC from them, but everyone else can buy it from them for $10. I believe the $10 also includes Codehead docs for NewDesk. The Icon Juggler is not an icon editor though; it edits the DESKICON.RSC. I'm pretty sure you can only move icons around, assign them to different files, and import icons from other files.

There is already talk of using the DSP for high-speed modeming
(9600-14400bps+) that would only require an interface for the phone
connection to the CODEC (A/D / D/A converter) and the software. The
interface shouldn't cost much, though. By "talk of" I mean as if it's
already planned. There is also talk of sampling/synthesis/effects
applications already being the works. And C-Lab is soon to release
Notator Logic for the Mac and Atari which should use some of the Falcon's
abilities. Likewise, Steinberg/Jones' new Cubase Audio for the Mac and
Atari should also be using some of the Falcon's abilities. By "8 channel
digital playback and record," what is meant is that the Falcon has a
built-in 8 channel multiplexer, but in truth the Falcon can only record
in 2 channels simultaneously since it only has a stereo input (although
an interface could be made for the DSP port which would allow 8 channel
recording, or even more). Likewise, without some kind of expander, the
Falcon combines/mixes the the 8 channels into 2 channels for playback since
it only comes standard with a stereo output. 1 minute of CD-quality
(44.1kHz) sound on one channel takes up about 5MB (5.046844482MB to be more
accurate), so 8 channels would take up 40MB. However, since you'd probably
need at least 5 minutes of recording time per channel, you'd really need
a little over 200MB of hard drive space. It would be an okay system to do
some relatively inexpensive digital 8-track demos on that you're going to
mix back down onto 2-track DAT or cassette, but you'd be much better off

with an Alesis ADAT (if they get the bugs out of it) or the like if want something more professional (and have the money).

The NeXT is a fairly popular research workstation, partially because of the built-in DSP (the same one in the Falcon). With the right interfaces for the DSP port, it can take in gobs and gobs of data and spit out results before you can say "go!" Okay, maybe that's somewhat of an exaggeration, but a DSP can do some mighty impressive things. Perhaps (and that's a big "perhaps") the Falcon will also be used by some researchers on a budget.

I've seen this happen with insufficient memory. If your have a 2.5M or less machine, you'll have to run it pretty bare (maybe just a cache and a CLI, or a small ramdisk) to run GCC 2.1. If you have 4M, then you shouldn't have memory troubles (except maybe two-deep in bash shells under mint, with a 720K ramdisk and 128K cache :-]).

> > - BLITTER 16 MHZ

>And how much memory can it handle??

This is an interesting question, since I believe even the more recent
Amigas have something like a 1-meg limit on "chip memory". The blitter
on the ST had no such restrictions and the Falcon blitter is fully
compatible with that one. I supose it could, technically be limited to
4Meg - since the entire ST could only (theoretically :-]) handle 4Meg.

> > Video:
> > - Hardware scrolling

>What about 'character screen' like the C64 and (i guess) 520 series. This lacks
>in the Amiga... (I'am an Amiga owner)

I don't think anything uses HARDWARE "character screens" (as in C64 and
Atari 800) any more - the 520 certainly didn't (the text mode their is
still graphical). The reason is that software "character screens" can
EASILY be updated faster-than-the-eye-can read. And after all, text
is only useful to be "read". Okay, tell me about redefined character
sets, and 4-pixel colour text and other fancies the old 8-bits had...
No point these days.

Oh, I forgot - PC's still have a text screen. For DOS.

>> Harddisk
>> - intern optional IDE-bus Harddisk (2,5")

>Included in the 500 GBpounds???? (if yes...count me in...)

Many have listed "$US1300" as Falcon+4Meg+65MegHD. Count me in on that.
(actually, tell me the price for 14Meg first - that's necessary for
serious multitasking in a development environment)

Herbert Martin Sauro (hrs@aber.ac.uk) wrote:
: Having now seen the Falcon at first hand (ie at the show) I was a bit
: disappointed at the graphics. The 640x480 at 256 colour appeared to
: be quite stable, almost as good as mono on an SM124. The higher colour
: modes however, weren't very good and a number of the monitors showed
: flicker which is a shame. But I guess with 640x480 2356 colour at least
: we're now up to Mac and PC standard. The sound system was very good
: though, I don't use my ST for music but the sound coming from the
: Falcon was as good as a CD.

I think most people were a bit disappointed with what they saw - that was
the impression I got. The 640x480x256 mode is non-interlaced on a VGA monitor
so it should be stable. Most monitors/TVs on the show however used the
interlaced modes - I guess Atari wanted to show off the true-colour
capabilities of the Falcon - that's were the flicker came from; not very
impressive.
There were some game demos on display: one Defender-like game which looked
quite good and another arcade-adventure-like game, which looked okay but
it took ages to load from hard disk - we are talking minutes(!)... not a
very good choice if you want to show off the speed of a Falcon.

I have to agree that the sound system was the most impressive thing about the
Falcon. The graphic modes are more or less standard, nothing you haven't seen
before but the in the sound department the Falcon shows its real strength.
It gives you more possibilities and better sounds than any other computer
system (in that price range anyway) - it's worth buying it for that alone.

I think the DSP will be a major reason to buy a Falcon if you buy one,
with this marvellous prossessor, by repogramming it, you can
emulate a modem, fax, correct the accustic of the room !, make easily soundtrack music (!),
help the 68030 (what will be great, as it is in parallel), so in one word,
the DSP in a wonderful little piece of art.

Amos.

Thanks for the info, klee@nyx.cs.du.edu

>>And how much memory can it handle??
>
>On another network, Atari software engineer (John Townsend) said the
>Blitter works in all (30) graphics modes.

What I meant is how much memory can it for exaple move in one 'instruction'.. Does it have a own bus for this? (I have heard that the MEGA-ST's blitter can conbtrol 4Mb..

>>What about 'character screen' like the C64 and (i guess) 520 series. This lacks
>>in the Amiga... (I'am an Amiga owner)
>
>I am not sure what you want. Macs, Amigas and Atari are graphics based
>computers so all 'characters' are really graphics characters.

The C64 has a screenmode there you can put a character on the screen with ONE move (or STA) instruction. The video DMA fixes the rest. If you for example do :

```
LDA #$00
STA $0400
STA $0401
RTS
```

There will appear two @'s in the upper left corner. (in normal mode) This makes text handling very fast. And this mode does not exist on the amiga (I miss it)

>Yes. For 9600 baud modem interface will be about $100! DSP I/O port

The newest amigas has 2MB chip memory. This is the maximum that can (also in the future) be used for the chipmem. (The area $00000000-$00200000 is reserved for chipmem) Lots of changes has to be made if commodore want to increase it.
On the Amiga running a code in chipmem while in hires with 16 colours, slows down the processor. And if you have a 68020 or higher (with a reasonable freq.), it can move data faster then the blitter...

Faster-than-the-eye-can-read is not fast enough. Remember that in games there are loads of other things to be processed in one picture frame. If display is updated in 2 raster lines, that would be better than 50. How about 16x16 user definable characters??? Or even X times X, where X can be selected.

> is only useful to be "read". Okay, tell me about redefined character

That's a new one to me. I was wondering when Atari would finally
update the "look" of the interface to make GEM more modern looking.
So is this 3D thing a part of TOS 2.07 and 3.07 or is it a part of
Multi-TOS or did it happen before this and I just missed it?

Is it possible to make FontGDOS available on atari.archive for those of us
without GENie access (and *dying* to see a copy!)?

Cheers,

I've got that beat by a mile.

I was on the third (?) level, at the place where you walk up to a door, which slams shut before you can get through it, then a message on the wall mocks you with 'None shall pass'. Of course, visible behind a blue transporter/force field is a treasure chest which I wanted. I hadn't yet figured out that you could chop some doors down (but then again, I also didn't know that Altars of Vi resurrected your characters) so I set to work trying to find a way through the force field. Eventually, I decided from the descriptions of the magical syllables in the manual that a spell of FUL IR (FUL, which controls the essence of fire, and hey, the field LOOKED kinda firey, and IR, which was the power of flight) would take the energy from the field, and make it fly away, right? Wrong. It was, of course, a fireball, which flew into the field, was transported behind my party, then slammed into them from behind. Now, this being only the third level, my adventurers were weak enough that even that tiny LO fireball killed them all. So, a slight setback, but after I restore my game, I had a ball (excuse the pun) torching everything in sight...

If it's freeware then it should be available anywhere. Anyone want to upload it to BART (a.k.a Atari Archive). I'd rather get it now than in two years from Atari UK.

1988. GEM.. what needs to be fixed, and soon!

Newsgroup: comp.sys.atari.st
Date: 1992-08-27 10:05:51 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992Aug27.100551.4716@bas-a.bcc.ac.uk>
Source record: 218296

From what I've heard, the new version of GEM for the FALCON seems a great improvement. I hope that at least some of the following gripes I have with GEM are fixed, and the rest to be fixed ASAP if the Atari machines are to get anywhere:-

(1) Response time for mouse button presses.

Has anyone noticed that it takes about a second for a mouse press to be acted upon under GEM? This delay is the same on the TT as on the ST. This has put off a large number of people when I've tried to promote the ST/TT for general use. It can be a right pain when you click on one item, move the mouse and the system highlights the one your mouse just passed over.

(2) Printer drivers have to be assigned at INSTALL time or by editing a file.

This is a MAJOR failing. Call the system user friendly? Even the first version of MS Windows had the capability to select the type of printer driver from a menu at any time.

(3) GDOS is an optional extra.

In these days any GUI-frontend without a built in scalable font generator is doomed. In my opinion a GDOS derivative (scalable font version) should be included IN ROM along with a minimum of fonts (eg Times Roman, Helvetica etc).

(4) The low-level character of the GEM interface.

In my opinion, the programming interface to GEM is too low level to be of much use to simple applications developers. If a higher level STANDARD library could be developed and released to the public FREE OF CHARGE (but NOT free of copyright) I believe the amount and the quality of GEM applications would increase by a great deal. This library should preferably be available in all the generally available formats, ie DRI, GCC, Turbo C etc. It should include (with the coming of such things as MultiTOS) the possibility of interrupt driven user interfaces (ie set up your handlers, tell GEM to get on with calling them then get on with your processing task, handy for processor intensive tasks which need to be able to cope with something such as a window resize/redraw/repair). Maybe it could be just a X emulation library (I know, straight X is horrid)with all the support libraries. This would at least increase the number of possible applications on the machines manyfold and give the machine a "standard" coding API.

(5) The low speed of the VDI routines.

The speed of plotting a pixel on the screen using VDI on the TT is
so slow... dumping a 320x240 picture using point plotting with VDI can take
up to a minute.. the is UNACCEPTABLE. The fastest possible algorithms for
the hardware should be used, else developers will just hack the system and
cause incompatibilities. This is bad for everyone.

Please note that I'm not saying MS windows or MacOS is the way to go... or
my machine in better than your machine. I'm just trying to say what I
believe needs to be done to make the Atari version of GEM a modern and
attractive (in the view of developers) GUI.

Steve

Please don't flame me, I'm just trying to help! :-)

PS. Not having done too much programming using GEM I may well be wrong about
the API, but I still think, whatever, that point 4 has at least some
validity.

In <94611@bu.edu> selick@csa.bu.edu (Steven Selick) writes:

>Just how programmable will the dsp chip in the new Falcon be? For
>instance, could one program it to emulate a standard modem? How fast
>would it be able to run?

I can't claim to have much understanding of this matter of my
own, but this is exactly what was said at the Falcon show at the
Atari Messe (done by the "grandpa" someone was sneering at
recently). He said the DSP has 96 KB of SRAM memory of its own
that can be loaded with any program. MultiTOS, he added, would
supply routines for entering programs for the DSP into a queue.
As examples for using this feature, he mentioned the use of the
DSP as a modem, a fax, or an answering machine. Regarding the
baud rates that could be done with the "DSP modem", I'd assume
that, since the DSP runs at 32 Mhz, the quality of the phone
lines will normally be limiting the transmission speed rather
than the DSP's capabilities.

>How about using the Falcon as a midi sampler?
>What polyphony would such a beast have? Perhaps a vocodor? It would seem
>that somebody who was a bit clever could even make the Falcon into a
>Yamaha DX-7, or even a more complicated machine, using MIDI as the key
>input. Could the dsp chip possibly be used for added processing power if
>you are using non-dsp programs?

DSP programs will have to be in the DSP's machine code (just as
things work with any processor). But as mentioned above, it seems
that it is possible to run any DSP program. If I remember that
correctly, in the c't article on the Falcon (in the september
issue) they were reasoning that using the DSP for
packing/unpacking various compressed graphics formats would be a
possible use.
So, to run non-DSP programs on the DSP, one might think of
writing DSP program that emulates another processor... maybe a
6502 emulator :-)

I wouldn't say the "perhaps" is that big, at least not here in
Germany. Ataris are quite popular at research institutes over
here -- remember that "Atari computers in tv" thread when there
was this report about two German nobel laureates showing one of
them in his lab which was full of Mega ST's. There definitely are
people who are familiar with Ataris and have the capabilities of
creating the hard- and software for such realtime data analysis
purposes.

1994. Older ROMs ok in Mega STE ?

Newsgroup: comp.sys.atari.st
Date: 1992-08-27 11:37:53 UTC
From: bbs.ruscal@tsoft.sf-bay.org
Message-ID: <u6X6PB2w165w@tsoft.sf-bay.org>
Source record: 218223

I am having problems running the Hybrid Arts ADAP 1 software on a Mega STE. On a regular ST, I can zoom a window and then evelope a small section of a waveform. On a Mega STE, the window zooms back out. I have eliminated software as a varaible, and now look to the ROM routines as the probable culprit. So the question is, can I load TOS 1.x ROMS in place of the 2.x ?

Please E-Mail response direct; I'll re-post appropriate info.

Thanks!

>OS/2's high performance filesystem?

Just a general guess, but I would suppose that since you can install different filesystems under Mint (like Minix) then someone would probably write a filesystem for OS/2. I wonder if this would also be possible to do it this way with MAC disks? I'm a novice when it comes to filesystem files, etc, but that is my general impression of what they do.

I doubt it will be "built-in" to TOS directly, but instead it would probably be released as a TOS extension, at least that way they keep the compatibility with the present ST's/DOS machines, and then could add the OS/2 stuff for those who need it...

>for my Mega STe so if I can get a 3D style I'd love to.....

Perhaps if someone has one of these new machines could maybe make a screen snapshot (in Degas or GIF format) and post it. I would assume that since it has been -displayed- in public then it shouldn't be breaking any non-disclosure pacts with Atari to do so? Of course, it would probably be smart to ask Atari first. Or better yet, maybe a screen snapshot could be included in an issue of Atari Explorer Online as one of their "bonus files?" Just a thought...

I TOTALLY AGREE

I am not using MiNT at the moment, because something with my GEMINI goes wrong, but I'm working on the ST text editor of the future, which makes use of the right mouse button to work in background windows. It is very annoying that mouse events are usually (at least not on my STE) not sent to background windows if the top window is not owned by the same application (I am talking about DA- multitasking now).
I sure wish this is going to change in MultiTOS, which is after all at the moment a more vital concern to all of us than just MiNT, I think.

Some of both, I guess. My expectations are based on conversations I
had with "non-marketroid" Atari employees and on a fairly brief but
early look at a prototype back in June. I have not personally tested a
Falcon to any reasonable extent.

>>like Atari's)

Well, as I understand it, there was a 30 day restriction in regards to the
GEnie upload of FGDOS; in that period the files could not be posted anywhere
else but on GEnie. Atari has taken a lot of flak over this policy but heck,
GEnie _is_ their official online service, ya know. Besides, the 30 days is
up now, I'm sure, so it should be free for uploading to any public BBS.

The HPFS is only used on hard disks, floppy disks are still written
using a FAT and remain compatible to DOS/TOS.

Well, I mean before developping on the Falcon, we all have to wait
to see how devices will be sold, and WHICH configuration will be
the more expanded..

For example :

o if noone buys a 1MegFalcon, and you do not need to
make your program with 1Meg..
o And if noone buys a Falcon, you do not need to
make commercial products..

Wait'n'see...

Geeez, Ed. Compared to what? Your TT? Your 486-66DX2? Your SGI? Your Cray?

Sure, a 16MHz 68030 is far from the top of the heap in the speed race. But it will be considerably faster than the 8MHz ST/STe or the 16MHz MSTe and will be cheaper than a TT with lots of extra goodies thrown in to boot. I am more than a little uneasy about Atari's marketing plan (plan?) for this beastie, but make no mistake, it will be a nice little machine for the money.... when and _if_ you can buy one!

|> conversion.

It might interest you to know that currently the new range of Roland samplers use fixed-frequency playback. The fact that older samplers use variable-frequency playback and moving anti-aliasing filters only makes them much more expensive, surely not better (in precision) than fixed-frequency DAC's.

Regarding precision, I'd rather `make do' with a fixed frequency DAC, using some good interpolation (quadratic) method, than relying on a moving anti-alias filter. Anyone who has any experience with analog filter techniques knows that filters, and especially state-variable ones, are always imperfect.

b.t.w., i am considering to try and write a sampler program for the FALCON. If you look at the specifications, it must be possible. I do not expect, however, to obtain a large degree of polyphonism (I think I would be quite happy to reach more that 10 `voices' simultaneously). To bad the 68030 doesn't run at 32MHz.

If anyone has suggestions as to which functions should be present in a sampler, mail them to me. I'm especially interested in those functions that are currently lacking in sold samplers.

It would be nice if the Atari desktop could also have multi-coloured icons
like W*nd*ws has. I was trying to think of a way it could be bolted on to
the exiting GEM interface but no clean solutions came to mind.
You'd think we'd be happy with 3D but no. :-)

#
If you install new fonts for TW, then I believe that you have to re-run
'FONTWID.APP'. However, as I have never done it before, I cannot be sure.

You're right about fontwid.app. Note that you also need to list all of the new fonts in the assign.sys files in ASCENDING order of their identity numbers,
and that all ID numbers must be under 128. You can change the ID # with most font editing packs (e.g. the ST Club's Fontkit). There's a doc on atari.archive giving lots of info on the mysterious assign.sys file and GDOS, I think.

Sam.

With the recent drop in TT prices, I'm considering purchasing one but first I'd like to know what people's experiences are with the TT.

So, for those of you who know, could you answer as many questions below as possible and I'll post a summary of the results to this news group in a day or so.

Thanks,

==========

1 . Do games like Falcon, Flight Simulator, Sim City, etc. run well on the TT? Too fast?

2. Does Calamus and other word processing packages work?

3. Has Minix been ported over yet?

4. Is there a Unix like OS for the TT? If so, has anyone gotton X11 R4 or X11 R5 to compile on a TT?

5. Are there any UNIXless X servers available for the TT?

6. If you own a TT, what are your impressions of the machine?

7. Which version of the Atari OS do the TTs run? 2.?? 3.??

Also, using this setup for the RAM in the Falcon030 will provide another way to expand the machine. Supposedly, a small graphics card (like a 1280x960 mono and/or 1024x768 color card) can use the RAM card connectors as well. This is according to Jim Allen of Fast Technologies. If it hasn't been mentioned, Jim is also already working on 40-50MHz+ accelerators for the Falcon030 as well as 68040 upgrade.

Source record: 218216

Supposedly, high speed FAX modems that use the DSP for around $100 are in the works. There may also be an interface and software available for the Falcon which decodes Dolby Surround Sound. Compression utilities which use the DSP are also in the Falcon's immediate future.

>
>-Morten Leikvoll (Is it short enough?)

The Falcon has a built-in stereo 16-bit CODEC (A/D COder & D/A DECoder).

Some people were wondering about the types of connectors on some of the ports
and they are as follows:

Bi-directional parallel port (DB25 Female)
Serial port (DB9 Male)
SCSI II (50-pin SCSI II connector)
Video (DB19 Male - 15-pin VGA/13-pin ST monitor/etc. adaptors are available)
Stereo output/headphones (1/8" minijack Female)
Stereo input (1/8" minijack Female)
DSP I/O (DB26 Female)
LAN (9-pin miniDIN)

Everything else is the same as on the STE (except, of course, that there is
no external floppy port). Atari also has new analog joysticks for the
'enhanced controller' ports. They have a joystick, 3 fire buttons, and a
12-key keypad. Atari is emphasizing using the new controller ports to
developers rather than using the mouse/joystick 9-pin ports.

The new 3D look is part of the new AES, which will be part of the disk-based portion of MultiTOS. It isn't part of TOS 4.00 (the Falcon's ROM verisons).

>Who ported this 2.41 to the Atari?
>Perhaps he should concentrate on 2.5, which is the current version.

I did. GS 2.5 had not been released when the original article was posted. I am working on the 2.5 port now, but will probably not post anything until 2.51, which is promised soon. Regarding the possible bug in 2.41, I believe the poster was using setup files from 2.31 with 2.41, which most certainly causes a crash.

>BTW: I'd like to have a color TT-VDI-driver implemented !!

The current screen driver does work in TT medium res (4 color), although the color mapping is messed up. I may add 8 bit color and try to fix the color mapping some in 2.51.

>> The program gemgs seems to have a bug, too. Together with NVDI version
>> 2.03 the program bombs, without NVDI it works, but the mouse pointer
>> looks like a busy bee all the time.

>What does gemgs do? Never heard about it. Sounds interesting!
>If these bugs are fixed, someone should upload it to a.a.

GemGS is a GEM shell for ghostscript. I know of at least one person who is using gemGS with NVDI, although I do not know which version. I have no way to investigate this problem (I have no NVDI), but source is included, and anyone who experiences difficulties is welcome to look for themselves (I would appreciate knowing if any problems are found).

One busy bee bug is fixed (but there is apparently another), and a couple of bugs not mentioned in the previous post have been repaired also. I plan to fix the remaining known bugs this weekend and will put the new program on lifshitz.ph.utexas.edu. As soon as atari.archive is back in working order (i.e. you can see what you want to download), I will upload all the latest ghostscript stuff there.

>

Surprise!!! The new AES that comes with MultiTOS not only has a new 3D look
to it, but it also allows icons to have up to 256 colors. So, you don't
have to be happy with just 3D. <grin>

Excerpts from netnews.comp.sys.atari.st: 27-Aug-92 GEM.. what needs to
be fixe.. Mr Stephen R Usher@ucl.a (3256)

> From what I've heard, the new version of GEM for the FALCON seems a great
> improvement. I hope that at least some of the following gripes I have with
> GEM are fixed, and the rest to be fixed ASAP if the Atari machines are to
> get anywhere:-

> (1) Response time for mouse button presses.

> Has anyone noticed that it takes about a second for a mouse press to
> be acted upon under GEM? This delay is the same on the TT as on the ST. This
> has put off a large number of people when I've tried to promote the ST/TT
> for general use. It can be a right pain when you click on one item, move the
> mouse and the system highlights the one your mouse just passed over.

Well, the same problem exist on Macs. And it is not so easily corrected: the
problem is with the double click: how could you know at the first click
if there
will be a second one or not ? You HAVE to wait. I know, you don't need to wait
when the click is long: it means it is a 'click-n drag' and that could
be improved !

> (2) Printer drivers have to be assigned at INSTALL time or by editing a
> file.

> This is a MAJOR failing. Call the system user friendly? Even the
> first version of MS Windows had the capability to select the type of printer
> driver from a menu at any time.

> In these days any GUI-frontend without a built in scalable font
> generator is doomed. In my opinion a GDOS derivative (scalable font version)
> should be included IN ROM along with a minimum of fonts (eg Times Roman,
> Helvetica etc).

Why in ROM in these days (just think of Macs, OS/2, Windows, Unix, etc..) ?
I personnally think that much more of the OS should come on disk ! (for
faster and easier updates)

> (4) The low-level character of the GEM interface.

> In my opinion, the programming interface to GEM is too low level to
> be of much use to simple applications developers. If a higher level STANDARD
> library could be developed and released to the public FREE OF CHARGE (but

> handy for processor intensive tasks which need to be able to cope with
> something such as a window resize/redraw/repair). Maybe it could be just a X
> emulation library (I know, straight X is horrid)with all the support
> libraries. This would at least increase the number of possible applications
> on the machines manyfold and give the machine a "standard" coding API.

That true (but I'm not sure whether better interfaces are common on other
architectures right now). ACS is a good way in that direction (for those who
don't know, it is a kind of 'interface builder' for GEM: a great
improvement over
RCSs). An OO standard language could also be an answer: why not switch to C++
(also I would personnally prefer Eiffel) instead of C ?

> (5) The low speed of the VDI routines.

> up to a minute.. the is UNACCEPTABLE. The fastest possible algorithms for
> the hardware should be used, else developers will just hack the system and
> cause incompatibilities. This is bad for everyone.

VDI is slow, that's true. BUT there is NVDI, which is much better and faster !
(of course it is not really part of the standard OS, bad luck). After
all, you'll have
to get used to slow routines: Xwindows, Display postscript, and the
likes are slow !

> Please note that I'm not saying MS windows or MacOS is the way to go... or
> my machine in better than your machine. I'm just trying to say what I
> believe needs to be done to make the Atari version of GEM a modern and
> attractive (in the view of developers) GUI.

I completely agree with you ! None of the widespread current OSes is good !
TOS is a bit 'older' than others. It needs much work. Maybe in 10 years
? Just wait'n see !

> Steve

> Please don't flame me, I'm just trying to help! :-)

>

I'd really like to know why you and Dave keep harping on _D/A_
conversion; for direct-to-disk recording I'd be a lot more concerned
about _A/D_ conversion. Speaking of which, does anybody know
_for_sure_ whether the Falcon has 16-bit A/D on board? One person
assured me it did, but when he sent me a copy of the specs as given
by Sam Tramiel, the point was actually ambiguous (the specs listed
16-bit _audio_ output, 16-bit _digital_ input). Note that the
presence of a microphone jack does not imply 16-bit A/D (compare
the NeXT: CODEC mic built-in, but for 16-bit A/D you need to buy
extra hardware.

I really thought we had settled the plural-of-virus question. The English
language plural of 'virus' is 'viruses' (the word is not a standard Latin
masculine form). The recommended plural within the Atari ST community is
(naturally enough) the German language plural 'viren.' The form 'virii'
is an abomination, and 'viri' is only slightly less uglii.

From: miked@syscon.rn.com
Message-ID: <1992Aug27.194010.23210@syscon.rn.com>
Source record: 218232

The ^D's are what tell the printer to go to Postscript mode. I have had problems with certain graphics images causing TWDTP not to print on a PS printer. Digitized pics converted to IMG and GEM from GFA Draft (even after being converted to IMG by Touchup).

2026. Re: Bug in Ghostscript 2.41 ?

Support is terrible, but hey, this _is_ Atari, and the mail-order place I got it from knew nothing about it (but it was cheap). But it does run lots of stuff nice and fast (enought to impress my friends) and some of it is even useful (e.g., running Mac stuff on Spectre puts real Macs to shame).

Concerning your question about the color printing:

Ghostscript 2.41 for Atari ST is able to print on a epson color printer.
Try lifshitz.ph.utexas.edu to get it. It should be in pub/ghostscript.
I did not try it on a epson color printer but it should work.

The Southern California Computer Faire is Sept. 12-13 at the Glendale Civic Auditorium (in Glendale, CA of course). General admission is $6 per person per day (or $10/person for both days). For more info, contact:

John King Tarpinian
c/o H.A.C.K.S.
249 N. Brand Blvd., #321
Glendale, CA 91203
(818)246-7276
GEnie: JOHN.KING.T

A showing of the Falcon030 at the Glendale show is expected, but not promised.

For some of the rest of you interested in the digital audio abilities of the Falcon030, for what it's worth, the output uses a bitstream 1-bit D/A converter w/ 80 times oversampling. Since the D/A converter is on the same chip as the A/D converter, the input may be the same.

4megs of RAM.

This model of the Falcon (with HD and 4megs RAM installed) is for dealers, like music dealers, that don't want to have to deal with installing their own hard drives and RAM. I suspect that most people in the know, like here on the network, will opt for the no hard drive/1meg RAM version and either have their dealers install the components or do it themselves. It's cheaper that way.

Upgrade your PC compatible 386/486 computer to TOS 2.06 for under $200!

This is just to inform everyone that Gemulator is being released at a new
lower price. Until September 14th, you can order the Gemulator board
and a set of TOS 2.06 ROMs for only $199, or you can purchase it
at the Glendale Atari show on September 12th and 13th for the same price.

This offer is being made by Purple Mountain Computers so if you have questions
call them (PMC) at 206-747-1519. The offer is not available through us.

2037. 2 meg 1040STe & monitor for sale...

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 02:19:12 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Aug28.021912.5998@u.washington.edu>
Source record: 218248

FOR SALE:

Atari 1040STe upgraded to 2 megs & SM124 monochrome monitor.
It has TOS 1.62, and it's about 8 months old. Minimal usage, like
new condition. Original packaging.

$500!

I'll include a homemade (nice!) monitor stand too.

If you're interested in a hard drive, I can put together a very nice
ICD Advantage+ system using all brand new components including a
Maxtor 65 meg 1" high mech and low profile case, for about $400.

Is this the 68040 running 60 MHz internally and externally 30(33?) MHz? Is the price, which was quoted at 3000,- DM right? Well, I am currently running a 486DX50 MHz (internal/external at 50 MHz) and it is fast so I can imagine how everybody was interested in that Board. I got prepared, got myself a motherboard that will handle the "overdrive" chip (100 MHz) once it is released by Intel. This never ends...;-)

From: baffoni@aludra.usc.edu
Message-ID: <l9rfk6INN9ja@aludra.usc.edu>
Source record: 218303

Hello All,

I am still having problems getting zoo 2.1 to work. It worked ok on
my ST so it must be a TT thing.

Well, I tried it with all .acc progs and /auto progs turned off. No
difference. I did as one poster suggested and used the "x file.zoo" command
and still the same problem. Is there a KNOWN bug that does not allow 2.1 to
work in TOS 3.01? I know that lzh works fine...

BTW, just to make sure that I didn't have corrupt files, I uploaded
my files to my UNIX host and unzooed my files (I just got my Supra V.32bis
and I HAD TO GET SERIALFX!) and then downloaded the binaries which worked.

So, can anyone help out here?

BTW, does anyone else have a Supra V.32bis? Sometimes (in Uniterm)
I type, the sd/rd lights go on, but nothing shows up on the screen - nothing
cures it reliably (not reset terminal, exit/load Uniterm). One thing that
did seem to help was going into Connect, and then exiting (I still don't
understand how to dial out once I have made a dial entry...). After doing
that it seemed ok.

Look in the new directory as fontgdos.lzh. Or rather don't look (you won't see
anything listed in that directory) but you can get it from there with ftp.

Do you know if this will work on graphic cards as well (should do, but one never knows...)? I'm planning to buy a CuberCube card in January or so.

BTW, does anyone know if I can just hook my TT up to a Hitachi 2087 (20" 1280x1024 color multisync monitor) and get the TT high mode? Some German firms advertises boxes to get all modes on a hi-res multisync. Any Germans out there?

: >
: >I don't know about me, for the moment I have very little money. Maybe
: >it will be spring before I have saved enough (that doesn't mean I'll
: >buy the Amiga).
:
: I'm a die-hard Atari fan, but even if I had the money, I wouldn't buy a Falcon
: right away. Let's take a look at the last two computers Atari released, the
: STe and the TT. The STe is now starting to have some software written
: specifically for it, but many software houses just don't bother, in the
: interest of staying ST-compatible with their new releases. Now, the TT has

I think the TT was intented for the more professional users; it's too pricey
for most ST users. While it's true that there doesn't seem to be a lot of
software around that says "TT only", you shouldn't ignore the fact that some
TT-software might still run on the ST because it doesn't use 60030 specific
code but still only makes sense on a TT (or STe).
The STe was just that: an ST with a little e(xtra). I don't think it
offers much more than an ST, so I can't see anyone "upgrading" from an ST
to an STe.
The Falcon030 is completely different. I think many ST users have been looking
for a faster machine with better sound and graphic capabilities at the right
price and the Falcon is just that. There will probably a lot of people who
want to upgrade and if there are enough users, Falcon-specific software will
be written.

: very little machine-specific software available, and considering the
: non-impact that the TT has had on the market, I would not expect too much
: more. In fact, if the Falcon is sucessful it may end up killing the TT complete-
: ly.
As far as I know the STe goes, the TT stays (for now). Considering what the
Falcon offers, it's much better value for money than the STe. The TT on the
other hand is still faster (and more expensive...)

See ya, Stefan

>C on the ST for that matter ?

For another C: you can find it on nikhefh.nikhef,nl in directory
/pub/atari/unix/curses. Wouldn't be suprised if other atari archives have
this as well.
It is not only curses.h, but also the associated library routine.
Runs only in tos mode -- no GEM support -- and only vt52.

Porting to Turbo C is rather straight forward (i have done it). If you
really can't work it out, drop me a line, and i might be able to dig it
up.

>68030 doesn't run at 32MHz.

I was talking to a friend doing programming for a local company
doing direct to disk system with their own hardware. Their evaaluation
of the 56001 was that it isn't quite fast enough to do 8 channels at
48k. They went with the 56002 instead.

Just to put this pro/non-pro discussion in perspective, there's a
thread in rec.audio.pro right now on digital recorders, cost and
comparisons to high-end analogue machines.

If I were going to design a professional quality direct to disk
recording system around the falcon, I'd use outboard dac's, and use the
dsp for manipulating the sound during editing. Most studios don't even
use the dacs that come with most multitrack digital recorders. The
better recorders even come with slots which can take custom dac's of
the customer's choice. One of the more popular is the Apogee. It
probably costs about as much as a Falcon.

For a lower end system, using the Falcon to edit tracks recorderd to
the Adat would probably be a fairly reasonable alternative th the Fostex
analogue system, for around the same amount of money.

Another interesting idea would be to use the 56001 to do various
digital effects, allowing complete editing, mixing and production in
the digital domain.

Appearantly there's a version of gas that produces code for the
56001. Hopefully we'll see a port to the Falcon in the future.

Drool, drool. I want it now! I presume the original set come up in colour and any regular additional icons from the Mega STE or TT come up in b/w. I guess there will be docs, and hopefully tools, regarding how to create your own coloured icons.

This explains why Atari are recommending that the first 16 colours of the 256 colour palette be left alone by the user. It's so the icons and windows don't look dumb.

2047. ST as Develpt Station

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 09:05:30 UTC
From: marre@tls-cs.cert.fr
Message-ID: <645@tls-cs.cert.fr>
Source record: 218310

I'm looking for a mean to use ST as a developpement station for a target system for educational use. That is, we want to develop romable programs with pure C and remoteload on the target with an terminal emulator as Uniterm.

A bad joke is that Uniterm and Pure C are uncompatible so we must quit each one for using the other with fastidious manipulations for a wanted 'easy to use tool'.
Does any one can help us, perhaps with another terminal emulator or other thing ??
Thank's for help.

Daniel.

I think the newer PostScript printers do not need the ^D anymore. What is missing from the PS created by TimeWorks are few lines of headers. I grabbed those header lines from a small PS file created by Windows Write on a PC and placed it at the beginning of TimeWorks PS file. It prints ok now. I think the newer PS printers now expect '%!' as the first two characters in order to be able to interpret PS correctly.

Why not just stop looking for the double click as soon as the mouse starts
moving? This would mean that click-and-relocate response time would be
acceptable but nothing else will change.

Also, there is no need to wait when you click on radio buttons, maybe the
routines should be made to be context sensitive.

It should be on ROM so that the innocent new users need not know anything to start playing.. ie Buy machine, install word precessor using manual to tell them what to do, run word processor... lovely fonts.

OK, if you want it upgradable, you buy the upgrade which just patches over the old version, just like official Atari patches do now!

>improvement over
>RCSs). An OO standard language could also be an answer: why not switch to C++
>(also I would personnally prefer Eiffel) instead of C ?

Because C is the most widely used development language used today.

As to whether better interfaces appear on other machines, it doesn't really matter. As the Atari machines are a small minority the coding interface of the machine has to be addapted so that it looks like one of the big boys (however awful that may be) so as to persuade big time developers even to look in the direction of the Atari. (If all it needs is a quick recompile of, say, the PC code of a word processor, or anything, without any rewriting then a software house is more likely to support it.)

>(of course it is not really part of the standard OS, bad luck). After
>all, you'll have
>to get used to slow routines: Xwindows, Display postscript, and the
>likes are slow !

Mostly true. But at least X etc have a resolution independent standard for
image formats. This means that whatever the machine the same code will be
able to be used to generate the pixel map to be placed in the window. ie you
don't have to worry about, oh this mode as this many planes, arranged in
this way, or whatever. You just generate a standard bit map and let the
libraries and servers do the rest. The nitty gritty of the hardware is no
concern of yours.

```
Well, things change. I just started to upgrade and now I have to sell.
So.

Hardware:
1040 STFM $125
SM124 Mono monitor (broken) $25
PC Case/Power Supply/3.5"/5.25" floppies $75
Avatex 1200 Baud Modem with cable $35
JRI SIMM Ram Expansion with 2 Meg (UNUSED) $150
ICD Advantage+ Disk Controller w/CLock (UNUSED) $90
TOS 1.04 ROMS, 6 Chip set (UNUSED) $50

Software:
Warp 9 Screen Accelerator (UNUSED) $35
Flash II Terminal Emulator (UNUSED) $30
Drafix CAD program $25
GFA Draft CAD program $15
Lattice C V3.04 $15
Personal Pascal V2.? with TackleBox $15
WordWriter ST $20
SwiftCalc ST $20
100 disks of PD with cases
Includes all common stuff (Sozo C, Bison, Xlisp,
archivers, tar, games, Caches,
various Vi's, Yale Star catalog, etc.
Also includes NASA Clips Expert System
language with source and hardcopy Docs) $50

Paperware:
Abacus Internals |
Abacus GEM | $25 for all
Sybex Programmers Guide to Gem |
Computes Programming in C |
C-Manship Complete with disk (NEW) $25
35+ Magazines with disks (Start, ST Format, ...) $35

Will take $750 for the whole pile. Can deliver within 100 miles of
Providence RI. Other shipping negotiable (all this makes a BIG pile).

No only that. You need to ensure the fonts appear in assign.sys in
ascending order of font ID :-(I have Timeworks book (forgot its proper
title) from the ST Club. It includes a section on how to install new fonts.

Double Click Software is in need of more qualified beta testers. We can't tell you what we are beta testing, but if you can read this, you should be qualified. <grin> If you are interested, you will be required to sign a non-disclosure in order to begin testing. You do not need to have any programming experience or technical expertise to test this new, unyet named product. You will need to have some time on your hands and a seriously fun attitude, but be committed to doing your part in helping us complete our product.

The last beta-testing we did on the internet went so well, we wish to do it again. Kudos to all of you netters! Keep up the Atari spirit.

Thanks,

Michael B. Vederman / president / Double Click Software

Have done this & the results are *excellent*.

[...stuff about problem deleted...]

When I started using the PS output, I too had trouble. I used the "to disk"
option and it was a disaster! I now use PSCAPTURE --- an accessory you
can get from a.a and all is well. Postscript interpreters expect to see
%! on the first line of the file so this acc puts:

```
%!PS-Adobe-1.0
%%Title: GEM Document
%%Creator: Atari ST GDOS
%%CreationDate: 08:24:54 04-03-1992
%%EndComments
```

at the start of the file and:

```
%%Trailer
%%EOF
```

at the end. All you need to do is set up the acc and pretend its a
printer it will then spool to the file you named in the set-up.

Good Luck.

> Later.......

In fact, this particular problem is not so important:
Just get used to double-click very quickly and then set the double-click speed accordingly: you won't have to wait too much when you single-click or when you click'n-drag !

2062. Snork demo, last session :

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 13:20:47 UTC
From: amos@prl.dec.com
Message-ID: <1992Aug28.132047.28522@prl.dec.com>
Source record: 218322

The Snork demo has been uploaded some minutes ago, here
we go :

The four files (snork 1a.msa, snork 1b.msa, so on with 2a and 2b) are in directory
atari/new

There come all the softwares, until the managers test them and store them at their places.
(atari/demos)

So just download them and look at the demo !

Have fun,

Samos.

2064. This is the status of Crack Art!

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 13:30:50 UTC
From: BWWL@ibm.rz.tu-clausthal.de
Message-ID: <16851CC1A.BWWL@ibm.rz.tu-clausthal.de>
Source record: 218318

Hi folks!

After a discussion with Detlef Roettger (one programmer of Crack Art)
I will summarize the status of Crack Art:

- The programmers are still busy to update Crack Art. (now again - because
a lot of users have asked them to do that...)
- The actual version number is 1.25 (1.30 will be released about Oct 92)
- Some of the new features:
+ more effects
+ printer driver (e.g. NEC, HP-Deskjet) color!
+ boot-dumper (start your game, press reset and grab the graphics)
+ load and save GIF (actual only 320*200, but the programmers are still
working on it)
+ support of Scanner (optional - not in distribution package)
+ two more games (tetris, pacman)
+ better menus etc.
+ lot of bug fixing (have you ever find one of them?)
- running on all STs, TTs etc. - some problems while running on Falcan 030:
block-operations crashes and some problems with fill-styles :-(
- new extra programs (not only crackart.prg+doc)...
- more than 1 MB Ram strongly recommended! (otherwise you only have one
or two screens)
- no english manual to the latest version, yet. (but a new, longer german
doc)

In the issue 10/92 of the german ST-Magazin there will be an article
about Crack Art.

The version 1.22 is avaible on Maxon-PD-Disk 550.
The version 1.25 is avaible via the programmers and will be on the
ftp-site sun.rz.tu-clausthal.de (139.174.1.3) next week.
(I will post a second messages after uploading it).
The version 1.30 will be released about end of Oct 92.

For further information contact the authors directly (and pay your
shareware fee ;-))

Detlef Roettger Jan Borchers
Vienenbuger Str. 27 Vititorwall 10
W-3387 Vienenburg 2 W-3380 Goslar

2065. Can't get LLAMATRON to work. Help!

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 13:42:35 UTC
From: dud@cbnewsf.cb.att.com
Message-ID: <1992Aug28.134235.389@cbfsb.cb.att.com>
Source record: 218325

Help! I've ftp'd, downloaded, unpacked, and tried to run LLAMATRON (the 1 meg version) on my 2Meg 520 ST, TOS 1.4. When I run it, the screen goes black. If I hit the mouse buttons or the joy stick button, I get all kinds of sound effects, but the screen is still black.

Since this is a game from the UK, do I need to be running at 50Hz for this to work? (I'm in the US, 60Hz land). Is there a program which will put the machine into 50Hz mode for games like this?

What resolution does the game want? I have a monochrome system, but I can run a color emulator (which us basically worthless for any kind of high speed play).

Thanks in advance.

Bill Dudley

>
>I TOTALLY AGREE

Part of me agrees; it's just that the current "system" doesn't work very well. It's definitely NOT completely sensible!

The problem occurs when one window is COMPLETELY obscured by the another. For instance, suppose I have the TOSWIN window covered by the TCSH window. I can't SEE the TOSWIN window - why should its menus activate when my mouse hits the (HIDDEN) spot where the TOSWIN is hiding? You can improve the rules, but the status quo has a problem, and this is where it lies.

Someone mentioned the DCTOPPER program; that is a utility that forces the window on which the mouse pointer lies to become the "front" window. That is a way of making the system WORK, and do what you'd like. Ideally, the features of DCTOPPER should go into TOS/MiNT/MultiTOS/whatever, preferably as an OPTION, and not as a mandatory feature (ala X-windows, where you can customize the environment...)

> is not a typo, could you let us know how it's done?

> I'm not trying to be funny or insulting. I've really and truely never
> heard of the ability to upgrade a 520ST to 3 Megs.

Well, 3MB STs are a bit tricky:
the 1st bank is a normal 2MB bank.
but the 2nd is treated specially: the two higher address bits (which are
multiplexed on 1 address line) are used to select one of 4 512K bank.
In fact, you fake a 2MB bank and fill it with 1,2,3 or 4 512K banks !
with 2 512K banks you've got 3MB RAM.

For the hardware, no problem: as soon as the bank respond after the 1st 512K,
it is assumed to be 2MB.
And for the software, no problems either: the TOS don't use the hardware
info to detect RAM size. Rather it checks linearly the RAM space until it
finds a fault which is recognized to be the memtop point !

For it you just need the RAM, 2 flip-flops and a few gates !
Notice, that very slow RAMs (150ns) may not work with this trick cause it
introduces a slight delay in RAM control signals ! Anyway, with nowadays
RAM prices, it is rarely intersting: just go to 4MB !

Tarpinian won't promise a Falcon will be present but _I_ can <grins>. Several developers intend to bring along their own Falcons even if Atari doesn't (but I rather expect them to as well).

Glendale is the largest Atari show in the U.S. and this year's event is shaping up to be a really good one with most every Atari developer planning to attend. It's going to be fun so be there! And stop by our booth and say "G'day", too!

You might want to take a look at CyberPaint and Cyber 3D-Cad (both by Antic Software), Deluxe Paint which is now being distributed by Golden Image with its optical mouse or the Phase-4 series by Lexicor Software Corp. These are but a few of the anaimation programs available. They can all be obtained from your local Atari dealer. If you have any problems you can call B & G ELECTRONICS 1-216-521-2855 or write 15729 Madison Ave., Lakewood, Ohio 44107. All of the above programs are currently in stock.

Kurzweil's supposed to be doing it soon, as well. Pretty neat. It means a
lot more internal number-crunching, but great audio results.

> The fact that older samplers use variable-frequency playback and moving
> anti-aliasing filters only makes them much more expensive surely not
> better (in precision) than fixed-frequency DAC's.

??...that was sort of my point, J. I was saying that samplers require
costlier hardware that isn't particularly better at the kind of clean
fixed-frequency reproduction involved in audio recording.

> Regarding precision, I'd rather `make do' with a fixed frequency DAC, using
> some good interpolation (quadratic) method, than relying on a moving anti-ali
> filter. Anyone who has any experience with analog filter techniques knows tha
> filters, and especially state-variable ones, are always imperfect.

Agreed. See above. And in addition to the imperfect filtration, there's
also the added noise that comes with analog components in the signal chain.

I have never heard of any ST being able to have 3Mb of Ram. I know a 520
can have 2.5Mb of RAM. But 3Mb a RAM is a new one for me. If this comment
is not a typo, could you let us know how it's done?

I'm not trying to be funny or insulting. I've really and truely never
heard of the ability to upgrade a 520ST to 3 Megs.

Can someone explain what a heat sink does and how it works? I get the
impression that it provides a larger surface area to the chip so that it
can dissipate heat faster. I think I've seen what they look like too;
it looks kinda like a vent, with the tall ridges. But how does it work?
It only looks like it's clamped onto the chip. And why is it that only,
at least from what I've heard, 80486 and 68040 chips need these?

The ST blitter definitively is NOT limited to 4MB - I already used it for blitting on a graohics card (at $C00000). It *might* be limited to 16M.

The only problem with this is the fact that you would have to hold
the mouse still for double-clicks. This would slow me down, since I've
gotten really sloppy on starting programs, but it's faster.

2081. Help compiling a special version of emacs 3.10s

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 19:23:38 UTC
From: max@neumann.cba.csuohio.edu
Message-ID: <1992Aug28.192338.18488@news.csuohio.edu>
Source record: 218340

Emacs 3.10s will not compile on my Laser C compiler, and I am therefore unable to tailor the program to my liking. atari.archive.umich.edu has a version with no color, with no reverse status line, and with incremental searches enabled.

Would it be possible for somebody to compile and link this for me to produce a normal, GEM desktop executable program with these options:

```
Option Setting Define in "struct.h" (may not be correct)
---------------- ------- ----------------------------------------
Color on #define COLOR 1
Reverse status line on #define REVERSE 1
Incremental search off #define ISEARCH 0
```

If you are kind enough to help me out with this, please send me a short reply using private email telling me that you could do it, and I will give you the go ahead. In this manner, I won't get ten copies and have nine people waste their time.

Thank you very much, Max

>OK, if you want it upgradable, you buy the upgrade which just patches over
>the old version, just like official Atari patches do now!

Thats a nice idea but! it is not very efficient. Remember ROM space
is pretty expensive: Monetarily, it costs more to put it in ROM, especially
since a "few basic fonts" are more than likely to go over 512k - space that
just isn't in the (I believe) 1MB ROM space (might be less); Design wise,
if you insist on putting it with the rest of the system code, you might be
looking at a space-squeeze, so if the fonts go in, something will have to
come out: Do you want to lose a)IDE/SCSI capability? b) MULTI-tasking?
c) GUI (3d, or whatever) ? - Whatever you pick, you are going to lose - just
load them in RAM and forget it. Besides, that way you only need load the
fonts you want, not what are just standard. However, they could make an easier

method of loading fonts (unless FSM/FONTGDOS is as simple as put font program in /auto, run font setup, select fonts to load (that should come on disk with system for basic fonts), never have to load those fonts again (either they are loaded onto floppy for those w/out HDs, or are loaded onto the HD and never be reloaded)).

a>pixelwonder sort of thing installed on an STE?

It is not possible. For autoswitch-overscan you have to interrupt a line
between the mcu (former called mmu) and the glue. Unfortunately in the STE
machines these chips are combined in one chip so it's a little bit difficult to
interrupt this signal line.

Timeworks Desktop Publisher works on a standard monochrome just fine. If you've already installed it for color, you will have to reinstall TDP first or (if you're clever) install the mono GDOS fonts off of the distribution disks and fool with your ASSIGN.SYS (??) file yourself.

I don't know about moniterm support.

Date: 1992-08-28 23:01:34 UTC
From: pvf@alantec.com
Message-ID: <pvf.715042894@diablo>
Source record: 218102

FOR SALE TO THE HIGHEST BIDDER...

1040ST w/Monochrome Monitor
Several boxes of assorted stuff
lots of software
joysticks and related stuff
Hippo Sound Digitizer
(probably more that I cannot remember now)

I haven't touched this stuff in ages.
It is time to get rid of it, so make an offer.
The first offer that doesn't insult me gets all of it.

Please contact me via email at pvf@alantec.com

2097. Zmodem 1.62 (J. Bammi version) compiling problems.

Newsgroup: comp.sys.atari.st
Date: 1992-08-28 23:45:37 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <qiq9PB1w165w@ersys.edmonton.ab.ca>
Source record: 218145
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi.

In my never ending quest to compile the Zmodem 1.62 source code, I have run across several problems.

There are repeated references to a PD MAKE tool. I do not have this tool, and have never been able to locate it. Is it GNU Make?

Also, how do you find out what version of Alcyon you have? I bought the developer's kit from Atari, but can not find any mention of a version number.

Boy, isn't C fun? (As you might have guessed, Pascal is the language for me. It seems to much easier to grasp.)

Last question: The DLIBS library is mentioned in the docs, in association with Alcyon C. I thought DLIBS was meant for Sozobon C? I have a version of DLIBS, but now I'm not sure at all what I should be doing to get Zmodem compiled.

By the way, the Zmodem archive came from GEnie and it is labelled 1.62.

Any help would be appreciated.

>find it if it is.

I got it with the Hermes v1.03 from a german site Stuttgart
(129.69.1.12) (I only have the number, all the names for it are
unrecogonised from here that i've seen)
I can't remember the path to it, try pub/atari/telecomm/hermes
wherever it is, it's in it's own directory calles hermes.
FTP all the files from that dir to get Hermes 1.03... Kosten is one of them.
there's a file called how2(something!), read that, it tells you how to
decompress it all.

From: u882453@bruny.cc.utas.edu.au
Message-ID: <u882453.715062634@bruny>
Source record: 218113

Could someone please answer these questions:

1.What is the DMA (?) bandwidth between DSP external RAM and main memory,

2.Does the 68030 have to halt while this occurs ?

3.Can the 16-bit 8 channel sound have independent frequency and volume
control (like the Amiga) for EACH channel.

thanks...

Andrew King u882453@bruny.cc.utas.edu.au

2104. How do I play .SNG files?

Newsgroup: comp.sys.atari.st
Date: 1992-08-29 07:13:26 UTC
From: ij59@vaxb.acs.unt.edu
Message-ID: <1992Aug29.011326.1@vaxb.acs.unt.edu>
Source record: 218115

HELP! I've just spent several hours downloading music players in an attempt to locate something that will play .SNG files contained in the file SNGFILES.ARC on atari.archive.umich.edu, but only 1 program (MIDISEQ.ARC) even asks for .SNG files, and it's idea of an .SNG file is not the same as the ones in SNGFILES.ARC. (It double-bombs when I try to read the .SNG files, except when I tried saving a blank one with the program itself. It read that one fine.)

There is also an SNGFILE2.ARC I have not bothered to get.

Please, if anyone knows what will read these files please e-mail me.
(Please don't just post it/followup here, because I don't read this area.)

System info: 512k Atari 520ST, 400k ss drive, composite monitor.

(Yeah, I know, just about the lousiest system one can own. At least I have a composite monitor now instead of my old b&w tv...)

I'm not sure if this answers any of your questions, but virtually
everything in the Falcon (BLiTTER, SCSI II, DSP, sound engines, and
CODEC's, at least) has DMA. Since the DSP runs in parallel with the
68030 and has DMA, I wouldn't think the 68030 has to halt for much of
anything.

Steve

> ||| Ed Krimen
> ||| ekrimen@wet.com
> / | \ E.KRIMEN (GEnie)

The power dissipation of a chip is proportional to his frequency and to the number of tramsistors packed on it (approximately)
It also depends of the use of all those transistors: on a highly parallel CPU (superscalar or just pipelined), transistors are likely to be all (or almost) used at all times. So that on such new CPU, the consumption is really high (can go above 1A).
An extreme example is a recent VAX CPU running at 100Mhz presented by DEC and which is likely to be comparable (for power consumption) to the alpha CPU (from the same company): It drinks about 6A on average! (and as consumption is not constant but is concentrated at each tic of the clock, at each tic the intensity goes up two about 30-40A).

All this power has to be dissipated for the simple reason that silicium transistors' reliability limit is at about 150-200 C ! (and those chips are not really big)

That's why !

Stefan Monnier

>it looks kinda like a vent, with the tall ridges. But how does it work?

Well, by providing a larger surface area (using very heat conductive
materials) you allow more heat to be dissapated into the air - since more
air molecules can contact the metal, more air molecules are able to absorb
the heat energy, thus cooling the heat sink, and thus the chip.

>It only looks like it's clamped onto the chip. And why is it that only,
>at least from what I've heard, 80486 and 68040 chips need these?

Usually, you only hear of the '486 and the '040 needing them because
a) they have a larger number of transistors per package and thus generate more
heat; b) they are the top of the line processors from each respective company
and thus are usually the targets for the overzealus power freaks who want to
run the chips faster than they are rated for.

Message-ID: <1992Aug29.160052.6976@zooid.guild.org>
Source record: 218124

jarleb@medusa.uio.no (Jarle Brinchmann) writes:
>I'm looking for the adress to ST-Magazine, also could anyone
>out there how much a subscription costs ?
>
>Are there any other german magazines that are worth getting hold of ?
>
>
> Jarle.
>

"ST-Magazine" is priced at DM 7,00 (German Marks) per issue. It is published by Markt & Technik Verlag AG and the address is:

Markt&Technik Verlag AG
ST Magazine
Hans-Pinsel-Strasse 2
8013 Haar bei Muenchen
BRD
Yearly subscriptions for germany are DM 77,00 for 12 issues. If you live outside germany, the magazines are priced as following (correct me if I am wrong, they might have gone up):

Air Mail; Country Group 1 (ex. USA) is DM 95,00.
Air Mail; Country Group 2 (ex. Hongkong) is DM 115,00.
Air Mail; Country Group 3 (ex. Australia) is DM 145,00.

"ST MAgazine" is approximately 150 pages and comes without a disk.

"ST Computer" is sold for DM 8,00 at newsstands across germany. It is published by MAXON Computer. The address is:

MAXON Computer
Schwalbacher Strasse 52
D-6236 Eschborn
BRD

Yearly subscriptions in germany are DM 80,00. Foreign countries are DM 100,00 and with air mail DM 130,00. This one comes without a disk.

"TOS" is another one and is priced at DM 14,90. Disk is included.

For students it's DM 129,00/year and regular it's DM 152,00/year. The address:

ICP-Verlag GmbH $ Co. KG
Leserservice TOS
Innere-Cramer-Klett-Str. 6
8500 Nuernberg 1

BRD

There is another excellent publication. The french "ST Magazine" but it is of no use if you don't speak french. Price: $8 Canadian. Contains source codes, reviews etc. Pretty much the same as all of the german magazines.

Sincerely,
Mark Kovarski

I can ensure you we have about 30 degrees Celsius here in
Deutschland these days... And we're not going to use high speed
68040 CPUs for heating our rooms :-)

Without kidding: The computer we talk about was in fact clocked with
60 MHz internally and 30 MHz externally. I was astonished myself
as I did not see any icecap or fan for the CPU.

Regards, Markus.

> on the TT? Too fast?
Most games definetly don't work due to various reasons. Sim City
works, very few other games do, too. The TT will never become a
game machine. If this is really your first question, you should
think about purchasing a Falcon, because most game programmers will
of course concentrate on that machine.

> 2. Does Calamus and other word processing packages work?
Yes.

> 3. Has Minix been ported over yet?
They're still working on it.

> 4. Is there a Unix like OS for the TT? If so, has anyone gotton X11
> R4 or X11 R5 to compile on a TT?
There's a System V R 4 from Atari Corp. containing X11/Motif and some
other neat stuff. It has only two problems: The ASV package is rather
expensive (in my opinion) and slow. But it is said to be quite stable.

> 5. Are there any UNIXless X servers available for the TT?
Yes, I saw a demo of a Xserver software on Atari fair, even on
the 14" VGA screen in color. You could easily switch between TOS
and Xserver mode.

> 6. If you own a TT, what are your impressions of the machine?
A good machine, but performance is lousy if you compare
the performance/money relation with a NeXT. You should better
look at the TT as a very fast ST and not as a workstation.
Yet, MiNT makes the TT worthy again.
Meanwhile, there are only minor compatibility problems left.

> 7. Which version of the Atari OS do the TTs run? 2.?? 3.??
TOS 3.06 is the latest release, however, everyone is waiting
for TOS 4.0 + MultiTOS.

Regards, Markus.

| it on my system (TOS 2.06), and havent gotten it to do that...

I have. It doesn't seem to matter what else is running, but I find
that the TOSWIN menus drop down even when the TOSWIN window is completely
obscured. I'm learning to live with it though.

Another thing that disappointed me slightly was that TOSWIN crashes on
startup if MiNT is not running.

- used it.

Okay, but how do I get Alcyon to use DLIBS instead of the library it uses
now (which seems to be nothing special). My only experiences with "make"
so far have been ones of total anger, since I can not get it to do what I
need. For a while I thought I was on the right track, but then it told
me that all of the files were up to date. No matter how I changed the
dates on the files, it held to that position...

Atari news saying that people bought out over 2 MILLION
Batman Returns game very fast!! Batman coupon said 'only good
for while Batman game stocked' so many people lost out on offer.
BUT Atari has good heart so they will mail Batman game to people
when their factory finished making more copies!

Also MANY more NEW Lynx games coming out in 3-4 weeks!!!!
By middle October 20-25 NEW games pouring out same time as
new Falcon 030!

Atari Lynx was top choice of VG&E magazine poll now smart people
of the world are throwing away PRETENDERS TO THE THRONE Game Gear
and Gameboy and saving huge eye doctor bill!

Hmmm again. What is your system configuration? Often, I press the right shift
key to bypass MiNT, and the only thing that TOSWIN complains about is
that it cant get a pty. This is due to TOSWIN.CNF starting up BASH and TOP
automatic upon startup...

Im extremely happy with TOSWIN. But there is a point that I should
state. When I try to start Elvis with a filename, it crashes the system.
But if I start without a filename, and use the internal read command, it
works fine. Nothing that really bothers me, tho

That can't be right. Do you mean that 2 million copies of BATMAN RETURNS have been sold or do you mean that brisk sales of BATMAN RETURNS have brought the total number of Lynx cartridge sales to 2 million? I can believe the latter, but not the former by a long shot.

Steve

2121. Loaded Atari STe system - US$975 obo.

Newsgroup: comp.sys.atari.st
Date: 1992-08-30 02:36:12 UTC

The short form:

Atari 520STe (4Mb, TOS 2.06, DEKA & IBM keyboard); 85Mb HD;
SC1224/SM124 color/mono monitors, monitor switch; WP, comm &
other software.
Atari 1040ST (1Mb, TOS 1.0) & 2 256K SIMMs.

Take all of the above for $975, and I pay shipping.

Call Adam at (415)873-3091, 8am-8pm PST, or email to
"atilghma@holonet.net".

The long form:

Atari 520STe (4Mb RAM, TOS 2.06 installed, with DEKA $350
keyboard adapter & IBM 104-key keyboard)

Atari 1040ST (1Mb RAM, TOS 1.0, internal floppy drive, $100
Golden Image mouse)

ICD FA/ST 85Mb ST-1096N Hard Drive $275

Atari SC1224 color monitor $175

Atari SM124 monochrome monitor $85

Color / Mono monitor switch $10

2 256K 8-bit/100ns SIMMs (bought with 520STe) $10

Wordflair II WP software (will transfer reg.) $40
(w/ dictionary, thesaurus, WYSIWYG)

STalker 3.02 Telecomm software $25

STeno 2.00 text editor software $10

Script WP software (w/ dict., mono only) $10
(stable on floppy-only systems)

Beckemeyer's MT C-Shell, including MT UUCP software $15
(get your machine on the net!)

Every other piece of software that I own (inc. $35
Personal Pascal, DevPac ST assembler, GFA Basic 2.0,
Hyperfont GDOS font editor, Flash 1.0, lots of PD
stuff)

Total: $1140

I'll let EVERYTHING go for $975, and I'll pay shipping.
Otherwise, you pay shipping. I'm open to haggling, since I pretty
much pulled these numbers out of a hat - make me an offer.

>when their factory finished making more copies!

IF Atari didn't make more copies, they would have a BIG problem.

This is because they advertised the free deal and now they aren't
going to deliver on their promise?

No, it doesn't matter that the coupon says "only good while supplies last"
because Atari supposely hasn't delivered ANY.

And it would be bad business to say to someone... "sorry, we ran out
so you are out of luck..." They would definitely bad mouth Atari
to all their friends.

It kind of ticks me off to see that Atari is playing the "good heart"
game! Get professional dudes!

>
>Also MANY more NEW Lynx games coming out in 3-4 weeks!!!!
>By middle October 20-25 NEW games pouring out same time as
>new Falcon 030!

I doubt that will happen. We have been hearing that there should
have been 10 games this month. It is now the 29th of August and
only two new games released.

>
>Atari Lynx was top choice of VG&E magazine poll now smart people

So how many basically non-compatible-and-require-new-software-to-take-advantage-of-it systems has Atari come out with now? Can you run old "well behaved" Atari software on the latest version of the latest operating system? Does it drag the system down when you do it because of all the polling?

>I'm looking for the adress to ST-Magazine, also could anyone
>out there how much a subscription costs ?

>Are there any other german magazines that are worth getting hold of ?

> Jarle.

I'm reading three German mags; ST Magazine, ST Computer and TOS regularly and
are planning to subscribe to the first two.
Hopefully others find this info useful...

ST MAGAZINE
150 pages+, stapled, very thin paper, 12 issues a year
Centered around hard- and software reviews, features a magazine-in-the-magazine
called Cicero which is a DTP mag by Calamus makers DMC (very ineresting if
you're into publishing and design), DIY projects. Not too much for developers,
but a few topics are discussed each issue with listings etc.
Shop price: DM 7,-
Sub. price: DM 77,-
DM 65,- for students (add a copy of your student card)
NOTE: I don't know if this works outside Germany...
Mail rates: Add DM 18 if in Europe, DM 38,- for AirMail to the US, DM 68,-
if you have a kangaroo for a neighbour...
Address:
Markt & Technik Verlag AG
ST MAGAZIN Leserservice
Hans-Pinsel-Str. 2
8013 Haar bei Munchen
Germany

ST COMPUTER
around 200 pages, squarebound, sturdier paper than STM, 11 issues a year
A developers dream in terms of featured material for programmers, few but
thorough reviews each issue, lots of text to read (My fave mag - i like to
read), projects.
Shop price: DM 8,-
Sub. price: DM 80,- in Germany
DM 100,- in Europe (Add DM 30,- for Airmail)
No prices for US or other regions
Address:
Heim Fachverlag
Heidelberger Landstr. 194

6100 Darmstadt 13
Germany

TOS
around 150 pages, swuarebound, best paperq. of the three, very nice design,
12 issuea a year (I think). Comes with a disk full of useful stuff like
demos of commercial software, sourcecode, PD utilities etc...
I think this mag is both technical and business orientated, with many reviews
and topics discussed, listings etc., but it has too short articles. It has a
VERY good design and layout which is easy and comfortable to read but the
articles leaves something to be desired. It's expensive as well, due to the
high quality printing and the disk. I buy it occasionally (when someone I know
is in Germany...)
Shop Price: DM 15,-
Sub. Price: DM 152,- (DM 129,- for students)
No info given for additional costs outside Germany.
Address:
ICP Verlag GmbH & Co. KG (What a name...)
Leserservice TOS
Innere-Cramer-Klett-Str. 6
8500 Nurnberg 1
Germany

My personal recommendation is ST COMPUTER. Dull layout, but LOTS to read.
ST MAGAZINE is cheaper and fancier, but might disappoint programmers.
As far as I know for scandinavians, ST MAGAZINE is available at Pressbyraan
in Sweden and should be available in Finland. I think I've found it in Denmark
as well.

Message-ID: <la1qntINNpn2@aludra.usc.edu>
Source record: 218139

In article <1992Aug28.214925.3165@actrix.gen.nz> Steven.Wells@bbs.actrix.gen.nz writes:

>Could someone tell me what all the diferent 'v' protocols and the MNP
>protocols on modems do?
>V22, V32, V32bis, V42 etc. and MNP 1 to 10 (if available)
>there are other V-protocols, like another 'bis' type (what does that
>stand for!?)

Bell 103:300bps standard, promoted by (guess who) the old monopolistic
Bell corp.
Bell 212A:1200 bps standard, promoted by Bell

V.21: 300 bps standard promoted by CCITT (forget what it stands for)
V.22: 1200 bps standard (CCITT).
V.22bis: 2400 bps standard (CCITT)
V.32: 9600 bps standard (CCITT)
V.32bis: 12k-14.4k bps standard (CCITT)
V.42: This is a protocol for error detection(correction?).
V.42bis: This is a protocol for error detection AND compression (real-
world results should be around 4X compression on uncompressed
data).

MNP1-3: No idea. These are standards promoted by Microcom (Microcom
Network Protocols). I would imagine MNP1-3 are equivalents
(BUT DIFFERENT) of V.21-V.22bis.
MNP4: This is a protocol for error detection(correction?).
MNP5: This is the Microcom protocol for compressed communications. Real
World results are about 2X compression for uncompressed data.
MNP10: This is a standard for communicating over Cellular lines.

Well, I know I missed some V.[something]ter in the V series, but I
don't remember which ones, let alone what they are for (well, one is probably
for cellular comm.).

Hope that helps!

>
>> SCSI II (50-pin SCSI II connector)
>Will a standard SCSI drive plug straight into a SCSI 2 interface (allowing for
>recabling it)? Would it show any improvement in speed like this?

Well, as far as plugging a SCSI-1 into a SCSI-2 socket, I was told that this is indeed possible, but someone on the net said that the SCSI-2 connector on the back of a TT is different. Now, he has not responded to my questioning of this, and no one else has spoken up about this, but I am still pretty sure that it is a plug and go proposition as SCSI-2 is completely backward compatable with SCSI-1. However, this may only refer to the 50-pin implementation.

However, you cannot get the same performance out of SCSI-1 hard disk connect to a SCSI-2 bus, as you will with a SCSI-2 drive. SCSI-2 incorporates a faster communicating speed, a "burst access" mode, and a "wide SCSI" utilization which is a SCSI bus that transfers information over a bus wider than SCSI-1's 8bit bus (not necessarily all implemented by HD manufacturers, or controller manufacturers for that matter).

Did you happen to notice the absence of the Lynx in both the Sears and
the J.C. Penny's CHRISTMAS CATALOGS? Someone isn't going to be selling
Lynxes this Christmas season...

What do you mean by real Zmodem with batch upload mode? FZDT uses XYZ 2.01 by Starfall software, and it indeed has a batch upload (and download) mode. Freeze Dried even has an auto-start option for the Zmodem. I don't exactly know what this arcv is, but I think it's some kind of command-line extenser (that lets you write an over 128 byte parameter line)? I can't see any reason for using it with FZDT, as it isn't a .TTP program?

>Most of the chaps that I know that use FDT tell me that its still full of
>bugs..

Well, it has bugs, I mean it bombs sometimes (ex. when you load a program that doesn't release all memory when quitting), but it's definetly not full of bugs. I can live with it.

The 50 pin cabling is known as twisted pair ground, and I suspect both SCSI I
and SCSI II are identicaly in this respect. The SCSI II 50 pin connector,
however, differ from SCSI I 50 pin in that the SCSI II is smaller physicaly.
Actually it has the same apearance as the 25 pin version of the SCSI I
connector, but with 50 tiny (easy to break) pins.

2135. *6:1* Audio Compression on the Falcon030

Newsgroup: comp.sys.atari.st
Date: 1992-08-30 22:03:37 UTC
From: Mark Kovarski <kovarski@zooid.guild.org>
Message-ID: <1992Aug30.220337.2861@zooid.guild.org>
Source record: 218154

Since the Falcon030 has attracted interest in the Audio field, I would advice any programmer planning on releasing Falcon030 Audio Software to read the "Dr. Dobb's Journal" July 1992 issue where John W. Ratcliff proposes a compression algorithm called "ACOMP" that yields better than 6:1 compression on human voice, and between 1.5:1 to 3:1 on music, while maintaining almost full fidelity. With the implementation of the DSP, this algorithm can be enchanced in order to speed-up the process, which is a very processor intensive one.

The algorithm incorporates two techniques, which are silence encoding and delta modulation. The entire algorithm source code in Assembly is included (for the Intel processors). This can be used not only for the Falcon030 but also the other line of Atari computers such as the (M)ST(E), and the TT.

Sincerely,
Mark Kovarski

>(Using software or hardware)
>--

You can do at least up to 19,200 baud on Modem port 1 on all ST's (with RTS/CTS and Serial fix are helpful)...

With the MegaSTe, you can do up to 153600 on Modem 2/Serial 2. Download the program ConNect 1.8i - it will let you use Modem 1, Modem 2, Serial 2, or MIDI for telecomm. I've done 38400 null modeming on Modem 2 myself...

Source record: 218150

The TT030 has a standard SCSI port, not a SCSI-II port, which is why it's different than the SCSI-II port on the Falcon. SCSI-II has a standard connector and that's what the Falcon has. To hook up SCSI-I peripherals to a SCSI-II port, you just need an adaptor.

> 3.Can the 16-bit 8 channel sound have independent frequency and volume
> control (like the Amiga) for EACH channel.

3) You bet. This thing is designed for multitrack digital recording. Each channel will have independent volume, panning, etc. Of course, the sample rate will probably suffer as you go for more and more full-frequency output. A single stereo pair will be capable of 50KHz playback, but when you do 8-channel mixing, you might (I repeat MIGHT) be limited to 25KHz/channel or the like. I don't know all the details on the DSP.

Cross-posted to: rec.games.video,alt.games.lynx,comp.sys.atari.st

I just bought a used EZ RAM II memory upgrade board but it didn't have any instructions with it. If anyone knows how this board is supposed to be installed, could you please E-mail me? Alternatively, the board is populated with 2 Meg of Ram (16 chips) that have 9 pins per chip. I have a 520 STFM with a 512k upgrade already in it. The chips I have in it now have only 8 pins on them. Is there some way I could use the chips without the EZ RAM board?
Any help on this would be greatly appreciated.

Thanx, Phil

> [...] I don't exactly know what this arcv is, but I think it's some
>kind of command-line extenser (that lets you write an over 128 byte
>parameter line)?

Yep. Roger is referring to the ARGV standard, the official method for
passing long command lines to programs.

> I can't see any reason for using it with FZDT, as it
>isn't a .TTP program?

Well, if you want to download a _lot_ of files at once, you'll have to
hand XYZ a very long parameter list. XYZ (presumably) prepares for this
eventuality by using startup code that knows how to parse arguments
passed to it via ARGV; the problem (apparently) is that FZDT doesn't
know how to _give_ args to XYZ via ARGV, thus losing the benefit of
long command lines.

[I'm merely inferring from Roger's description here; I've never used
FZDT, so I can't speak with authority.]

No, you'll have up to 50kHz playback. The D/A converter is a two-channel
(stereo) converter that operates up to 50kHz and a built-in multiplexer
handles mixing the 8 channels down to 2 channels before it's input to
the D/A converter for output.

Some more info has recently been posted on GEnie concerning the digital
audio on the Falcon, but I haven't read it yet, so I'll post the
essentials, if any, later.

The Golden Image and Migraph hand scanners support some kind of greyscaling-
I only use it for monochrome, but it does report dithered patterns then.
They are fairly cheap - probably about $US250 tops (since I bought one
for $AU450 - and it was imported of course).

2146. Errors when dumping EMACS 18.58

Newsgroup: comp.sys.atari.st
Date: 1992-08-31 06:48:58 UTC
From: PAULETTI@biel.be.tech.ascom.ch
Message-ID: <1992Aug31.064858.17975@hasler.ascom.ch>
Source record: 218165

```
Hi

Over the weekend I tried to install the emacs 18.58 I dounloaded from
cs.ruu.nl (file : ATARI-ST/gnu/emacs). When I try to dump EMACS using
the dumpemacs.ttp in the e-bin directory I get the following error
message

This is `dumpemac', the coffee break edition
written by Frank Ridderbusch

The dumping procedure takes about 13 minutes and 30 seconds
on a normal ST. So, it's time to have a coffee break. You
should be back at around 17:17 o'clock.

First dump. Commandline: .\temacs -batch -l loadup.el dump

>>>Cannot open load file: loadup.el

The environment variables I set (in tcsh.rc under MiNT) are the
following

setenv EMACSLOADPATH /dev/H/gnu/emacs/e-bin
setenv EMACSLIB /dev/H/gnu/emacs/e-lisp
setenv EMACSDOC /dev/H/gnu/emacs/e-etc

setenv UNIXMODE "/.,LAHdb"

The un-ZOO-ed files are in the following directory structure as it is
stated in the file documnts/st-emacs.doc with H:\GNU\EMACS as the top
of the tree.

---d- 0 28.08.97 16:40:54 documnts
---d- 0 28.08.97 16:41:28 e-bin
---d- 0 28.08.97 16:43:24 e-etc
---d- 0 28.08.97 16:44:46 e-lisp
---d- 0 28.08.97 17:12:50 examples
----- 1355 16.07.92 18:40:08 readme.1st

I tried the brut force method and copied all .el files in the e-bin
directory and runed "dumpemac.tos". The effect was, that it found
the files, but after about 8 files the program aborts with the
following message.

>>> Pure Lisp storage exhausted

My machine configuration is :

520ST, 4MB-Ram, TOS 1.0 (still waiting for MultiTOS !)
```

Is there a kind soul that could help me.

cheers andreas pauletti

>really get about 12-14 bits worth of real-world resolution. This
>is marvelous for most applications (like adding little sound effects
>to your desktop), but not good enough for real studio work.

But what's "real studio work" really mean? It's just another elitist atti-
tude. Look at the effect that samplers have had on the the Rap, House,
Jazz, Avant-Garde, etc. field. Look at what 4 track tape has done for
punk rock. Look at what "low quality" home video has done to network TV.
Look at what Quicktime, a noisy, low quality video format has done for
computer video. Look at what the Amiga and Video Toaster are doing to the
video industry.

The Falcon is a potential "discount studio" for bands and home studio
builders. It can allow the rank amateur to dabble in adding effects to
the sounds they record.

If Atari did the right thing, there is a port for direct connection to the
DSP so you can add on your own A/D and D/A circuits.

Of course, all of this is moot if the Falcon dies in the marketplace: remember
that as of today, it cannot run Mac or PC CD-Roms, it cannot even use the data
on Mac and PC CD-Roms. CD-Roms are the only popular medium which will allow
someone to use all of the Falcon's sonic and visual features.

2150. Bugs in Mint0.95

Newsgroup: comp.sys.atari.st
Date: 1992-08-31 08:31:20 UTC
From: muts@fysap.fys.ruu.nl
Message-ID: <MUTS.92Aug31103119@ruunfs.fys.ruu.nl>
Source record: 218190
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

When I did the upgrade from 0.94 to 0.95 I hit two little bugs in the
news version:

1) When a filesystem (minix.xfs) is in / instead of in /mint, it gets
loaded twice (at least I see the copyright notice of minix.xfs twice).

2) There is something wrong with cursor handling when using
/dev/fasttext, which used not to be. The cursor is not blinking
anymore, and when I hit return often the black spot remains on the
last line. Also, in an editor the cursor often is not visible at all.
Note that this did not occur with TOS things like gulam, but with my
version of bash and microemacs; I compiled these for the plain unix
version (which works fine and is nicer than the TOS versions).

regards,

Command lines can be used by any program, it does not have to be a TTP..

arcv is the way that file name strings should be passed to the SZ program,
but XYZ201 requires a file with the file names in it to do this,
this is one big thing that I dislike, they must follow the standard and
use arcv..

>anything this way.

There wasn't much he could do apart from telling us what might be possible
and what could be done - not because the Falcon isn't able to handle it at the
moment but simply because the software isn't available yet. That's hardly
surprising however, considering the fact that the Falcon has just been
released.
Apart from that, when he was talking about image processing for instance,
he mentioned the photo-CD - a medium which itself isn't available yet.
The few demos they had showed real potential - a demo says more than
1000 words.

2154. STZIP20.TOS

Newsgroup: comp.sys.atari.st
Date: 1992-08-31 11:00:47 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Aug31.110047.24827@peponi.wcc.govt.nz>
Source record: 218168

Well I have just uploaded stzip20.tos (126k) to the atari/new directory
on A.A...

This is a ST clone of PKZIP 2.0, has english doc's and
a self extracting utility program..

This program has a Gem shell for those like me, that like to use the Ataries
GUI...

NOTE: This is a self extracting program, so make sure that you have room
on your disk before you run it, more that 410k..??

Roger..... sheppard_r@kosmos.wcc.govt.nz

>

GEM needs this time to determine the difference between a single and double
click. Just set the double click speed to 4 (maximum) and your mouse buttons
will react a lot faster. (You will have to learn the double click all over
as well...)

Wow! I found out on GEnie from Atari that the new icons can not only be very colorful (or colourful for you Europeans out there), but they can also be ANIMATED. Yes, ANIMATED icons as a standard feature. I think they may have taken it too far this time. <grin>

Also mentioned from Atari is that they showed a direct-to-disk stereo 16-bit digital sampling software packaged called "D2D" (cute, huh?) at the show which includes sample editing functions. They also demoed the Falcon's DSP with some digital audio effects (reverb, delay, flange, chorus, etc.) software.

And in the latest Atari Explorer Online, it was revealed the Falcon030 will be bundled with several pieces of software including but not limited to several games written specifically for the Falcon (don't expect any 'too fancy' games here, but rather some 'old standards' like a breakout clone and a few others), a talking clock program, a

calendar program, a phone/address program, and a few more. No word on a Falcon BASIC, though. <grin>

Despite rumors that Atari won't actually deliver the Falcon030 in the U.S. until at least April '93, Atari is still sticking by its initial "limited quantities around mid-October" statement.

More news to come!

Steve

Speak for yourself! Personally, I'm sick to death of all these lame demos. They're not good for anything. I wish the people who did some of these things would do something productive and useful with their talents rather than all this demo crap. I wouldn't even mind if they were just graphics and sound demos as long as they didn't have all those stupid, boring, useless, immature, and annoying scrolltexts/greetings/credits. The SNORK demo claims to be 2 years in the making -- what a waste of time!!! If everyone's seen at least one demo, there's nothing new to see here, so save your time getting the 1.5MB of files for this yet-another-lame demo. I downloaded it because of the hype it was getting, so I thought it was different. My mistake! It's the same damn crap that's in every other demo disk.

Message-ID: <1992Aug31.123840.1064@ludd.luth.se>
Source record: 218175

Aloha! I'm quite interested in the new Falcon, but I NEED to
get the real specs, not just the rumours. If anyone could help me out,
I would surely appreciate it!

The things I want to know is:

Processor: Which 68030 version
Busses: 32 bit in the machine or fucked down like the AMIGA 3000,
bandwith and so on...
DSP: speed and everything.
The blitter: any changes (32 bit and so on...)
The sound chip: Same as above
Graphics modes: I've heard quite alot of garbage and rumours. If anyone could write down
the real modes... Is it true about all those interlace modes???
(Thats REALLY bad!)
OP system: I haven't used an atari before, but I heared soemthing about a
UNIX clone. Even if it's not true, is it using the full 32 bit possibilities
Ports:MIDI and so on.
Casings: is it still the same casing as the ST(e)???

That was all the questions I had. The more specific, the better..
Thanks!

From: ronw@cbnewsk.cb.att.com
Message-ID: <1992Aug31.143953.15283@cbnewsk.cb.att.com>
Source record: 218180

I have DynaCADD version 1.8 for sale. If you are not familiar with it, DynaCADD is a full featured 2D/3D design program. It supports CALMUS fonts, many output formats including dxf has plotter drivers etc. It does require at least 2 Meg of memory to be usable and a coprocessor really speeds things up (such as dynamic rotation of a part!). If you are serious about CADD, this is an excellent program! I would like to get $285 for this package.

2166. Error in NVDI or in TOSWIN?

Newsgroup: comp.sys.atari.st
Date: 1992-08-31 15:09:55 UTC
From: kring@efes.physik.uni-kl.de
Message-ID: <1992Aug31.150955.9518@rhrk.uni-kl.de>
Source record: 218184

Some weeks ago Eric R. Smith posted a small program `runtos.c' in
comp.sys.atari.st. It works very fine when used without NVDI.
But when I use "Install Application" as described in the file `runtos.c'
and when I have NVDI installed, I get an error after (!) `runtos.prg'
returned. Some parts of the desktop are already redrawed, when an alert
box appears, which tells me that VDI was called with the invalid handle
$FFFF.

If I type

echo /bin/hello.tos >> u:/pipe/TOSRUN

while running `tcsh.ttp' and then quit TCSH, the same error occurs. So I
guess it is an error either in NVDI or in TOSWIN. Has anybody made
similar experiences?

I am using the german version of NVDI 2.01 (the date is 21.10.1991) and I
cannot find a version number in toswin, but it came with MiNT 0.95.

Jochen.

VinK - Voss is not Kring

You can e-mail me at `kring@physik.uni-kl.de'.

2167. Digital Stereo 10-Band Graphic Equalizer of the Falcon030 (Using DSP)

Newsgroup: comp.sys.atari.st
Date: 1992-08-31 15:44:18 UTC
From: Mark Kovarski <kovarski@zooid.guild.org>
Message-ID: <1992Aug31.154418.14816@zooid.guild.org>
Source record: 218186

This is to all people who would like to connect a Digital Stereo 10-Band Graphic Equalizer. Document number APR2/D by Motorola deals with this matter and can be obtained free of charge from Motorola. You can either call them and ask for the document number or you can write to:

Literature Distribution Centers:

USA: Motorola Literature Distribution, P.O. Box 20912; Phoenix, Arizona 85036; United States of America.
Europe: European Literature Center; 88 Tanners Drive. Blakelands Milton Keynes, MK145BP, England.
Asia Pacific: Motorola Semiconductors H.K. Ltd.; P.O. Box 80300;Cheung Sha Wan Post Office; Kowloon Hong Kong.

Most likely the document will be available from your local Motorola office but if it is not, you can obtain if from the above addresses. The Equalizer is build with the following components: 1-2716, 1-74LS374, 1-ADC0804, 4-HC4051 and the source code is also included. The implementation into the Falcon030 and future line of Falcon computers is rather straight forward.

Sincerely,
Mark Kovarski

>have been sold or do you mean that brisk sales of BATMAN RETURNS have brought
>the total number of Lynx cartridge sales to 2 million? I can believe the
>latter, but not the former by a long shot.

Atari's sold more than 2 million Lynxes, so I don't believe that there were fewer than 1 game sold per Lynx, especially since most Lynxes sold have included a bundled game or two (which would count as 'sold' since people paid for them). Remember, Batman Returns is sold not only by itself (and reported selling pretty well) but is also given away with every Lynx sold for the past few months, with a big movie tie-in, so I could see 2 million copies of the game sold. In a way it's surprising, since it's not that great a game, but I guess that movie tie-ins and run-around-and-kill-thugs games with "bosses" at the end of every level both sell well, so a (for Atari) highly promoted game that fits that combination ought to do well.

2170. Re: Falcon's DSP (again)

Yes, virtually everything has direct access to main memory, including the
DSP, BLiTTER, SCSI-II port, and more.

2171. Re: The REAL Falcon specs wanted!

Newsgroup: comp.sys.atari.st
Date: 1992-08-31 19:47:19 UTC
From: kjohnson@castor.cs.uga.edu
Message-ID: <1992Aug31.194719.17630@athena.cs.uga.edu>
Source record: 218188

Okay, here it comes...again!!!

Atari Falcon 030 Specifications

CPU: Motorola 68030 32-bit microprocessor @ 16MHz w/ 32-bit bus
FPU: Motorola 68881/68882 @ 16MHz (optional)
DSP: Motorola 56001 Digital Signal Processor running in parallel @ 32MHz
w/ 32kWords (24-bit) of local zero wait state static RAM
ROM: 512kB
RAM: 1, 4 or 16MB(14MB usable) on daughterboard (RAM is 32-bit wide)

Expansion bus: Internal 'Processor-Direct' slot for 386SX emulation
(third party 386SX emulator nearly completed) or other
co-processors/etc.

Video: (See below for specific video modes/resolutions.)
16-bit BLiTTER @ 16MHz (also handles hard drive access)
Accepts external video sync to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan support
Hardware-assisted horizontal fine scrolling
VIDEL (video controller) sits on 32-bit bus

Audio: Stereo 16-bit Analog-to-Digital DMA input
Stereo 16-bit Digital-to-Analog DMA output
Eight 16-bit audio DMA record/playback channels
SDMA sound/DMA co-processor

Ports: 128kB cartridge port
2 9-pin mouse/joystick ports
2 15-pin STe enhanced analog/digital controller ports (Atari also
has new analog controllers w/ a joystick, 3 fire buttons, and a
12-key keypad)
MIDI IN, OUT/THRU
Bi-directional parallel port
RS232C serial port
SCSI II w/ DMA
Analog RGB/VGA/composite video connector
Stereo headphone out (1/8" mini-jack)
Stereo microphone in (1/8" mini-jack)
DSP port (up to 1MHz data transfer rate)
RF modulator for TV hookup
Localtalk compatible LAN (up to 250kbaud transfer rate)

Misc: Internal 1.44MB 3.5" HD floppy
Internal IDE 2.5" hard drive (optional)
Pre-emptive mulitasking OS (MultiTOS) w/ adaptive prioritization
and inter-process communication (also 68040 compatible)
Realtime clock and battery backed up RAM
1040ST-style case w/ internal fan
North American availability in mid-October

Price: 1MB/no HD - $799 list
4MB/65MB - $1399 list

Resolutions available on the Atari Falcon030 (c) 1992 Atari Corp.
Written by John Townsend
==========
This document may be re-printed again and again as long as the Atari
copyright remains intact.
==========

A couple of notes: Unlike previous machines, there are just too many
resolutions to give each resolution a name. Therefore, I will do my best
to describe what the resolution is and which monitor it is on.

- NOTE: TV and a Color Monitor are the same.. by Color Monitor, I am
talking about the standard SC1224. By VGA, I mean a standard VGA
Monitor.

40 column modes ("column" means the number of x pixels divided by 8)
---
4 color, normal, TV: 320x200, 4 colors, 2 planes
16 color, normal, TV: 320x200, 16 colors, 4 planes
256 color, normal, TV: 320x200, 256 colors, 8 planes
True color, normal, TV: 320x200, true color

4 color, interlace, TV: 320x400, 4 colors, 2 planes
16 color, interlace, TV: 320x400, 16 colors, 4 planes
256 color, interlace, TV: 320x400, 256 colors, 8 planes
True color, interlace, TV: 320x400, true color

4 color, normal, VGA: 320x480, 4 colors, 2 planes
16 color, normal, VGA: 320x480, 16 colors, 4 planes
256 color, normal, VGA: 320x480, 256 colors, 8 planes
True color, normal, VGA: 320x480, true color

4 color, line-doubling, VGA: 320x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 320x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 320x240, 256 colors, 8 planes
True color, line-doubling, VGA: 320x240, true color

80 column modes
---
2 color, normal, TV: 640x200, 2 colors, 1 plane
4 color, normal, TV: 640x200, 4 colors, 2 planes
16 color, normal, TV: 640x200, 16 colors, 4 planes
256 color, normal, TV: 640x200, 256 colors, 8 planes

True color, normal, TV: 640x200, true color

4 color, interlace, TV: 640x400, 4 colors, 2 planes
16 color, interlace, TV: 640x400, 16 colors, 4 planes
256 color, interlace, TV: 640x400, 256 colors, 8 planes
True color, interlace, TV: 640x400, true color

2 color, normal, VGA: 640x480, 2 colors, 1 plane
4 color, normal, VGA: 640x480, 4 colors, 2 planes
16 color, normal, VGA: 640x480, 16 colors, 4 planes
256 color, normal, VGA: 640x480, 256 colors, 8 planes

4 color, line-doubling, VGA: 640x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 640x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 640x240, 256 colors, 8 planes

and lastly.. there are compability modes for ST Low, ST Medium, and ST High on both VGA monitors and SC1224 monitors. (On a color monitor, ST High is achieved by using the interlace mode).

Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as well. However, it only supports one resolution: ST High Resolution.

All modes on a TV can be overscanned. This means multiplying the X and Y resolution by 1.2. For example, modes with 320 pixels of horizontal resolution (X res) will become 384 pixels across, and modes with 640 pixels will become 768 across. Overscanning is done in the X and Y resolution. You can't do them independently. Special Note: On a VGA monitor, overscan is "faked".. since the video hardware doesn't have the capability to do overscan on a VGA monitor, we made it so that if a overscan mode is set on a VGA monitor, you still see the normal size screen, but the screen is a window onto the bigger overscanned image. Make sense? We did this for compatibility. This way if a game that has an overscanned starup picture can use the same pic on both the VGA monitor and the TV monitor. Pretty cool, eh? <grin>

BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will work just fine with it, but because you can't see the parts of the screen, we thought that that option shouldn't be available from the desktop. We don't want to confuse people. However, Overscan can be set using a new XBIOS call (Vsetmode()).. so it is still available.

I hope I haven't made any mistakes. I triple-checked this document in search of errors and I couldn't find any. If you do find some, send me Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.

-- John Townsend, Atari Corp.

P.S. Anyone who would like to reprint this message, please do so! The smaller the number of times I have to type that message, the more my fingers with thank you! ;-)

After looking at this one more time.. one point to clear up: By saying SC1224 Color Monitor, I mean any Color Monitor that Atari

have manufactured for the ST/Mega/STE/MegaSTE computers. Clear as mud? ;-)

> (Thats REALLY bad!)

The interlace modes are mainly there for TV output (since TV is interlaced anyway). I seriously don't understand why everyone's going nuts about it.
If you don't want any interlacing, just get a VGA monitor.

Steve

2173. Re: Zmodem 1.62 (J. Bammi version) compiling problems.

If you have your dependencies set up correctly, touching your .c files so that they have a more recent date ought to generate a recompile by make. You can always remove your .o files and then make has to recompile them.

Makefiles are ugly beasts to hack (I'm thinking UNIX and VME systems mostly) but once you get it set up, make sure makes life easier.

Can anyone tell me where I can get communications software that will run on a 1040ST without a hard drive (just one floppy)? If there is a shareware or public domain program available, please tell me where I can get it. Please tell me if there is an FTP site or a phone number where I can download.

If not, please tell me where I can get a catalog where I can order this program. It has to be able to support Kermit and Xmodem. Please help - I haven't found any place in Florida that sells anything for ST. Please respond by E-mail or post.

> With the MegaSTe, you can do up to 153600 on Modem 2/Serial 2. Download
>the program ConNect 1.8i - it will let you use Modem 1, Modem 2, Serial 2,
>or MIDI for telecomm. I've done 38400 null modeming on Modem 2 myself...

I have a couple of problems, and perhaps you (or someone else) can
help as I don't know any German and thus cannot read any of the docs (I did
figure out the renaming conneng.rsc to connect.rsc).

How do you get Connect to autostart a zmodem download? I have auto
start selected, xyz.ttp is in the paths, RS232C is setup correctly.

How do you get Connect to translate 8-bit/1stopbit/no parity correctly?
Uniterm works correctly at this setting. Connect translates it like every
IBM I have ever seen - it forces (somehow) the other modem to connect at
7-bit/1stop/even parity. I have never seen an IBM connect to another machine
at 8/none. I know it forces the 7/even because I can change it (while still
connected) to 7/even and everything is fine. Also, it must be the translation
because I can log in blind and all of my commands work fine, even if the
characters on my side make no sense.

I know that I can highlight text on the screen, but how do I capture
it and a) save it to a file; b) send it back to the modem; c) save it to a
buffer of some kind?

Lastly, does connect have a history buffer? If so, how do I set it
up and utilize it?

> Robert Anisko
> anisko@usdtsg.daytonoh.ncr.com

Thanks for any help. Connect looks like it could work really well,
if I could only get it to work right! :)

-Mike

2177. ZOO/ZIP/ARC/LZH

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 01:43:04 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Sep1.014304.22255@actrix.gen.nz>
Source record: 218199
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here is a comparison of the four most used Archiving utilities on the Atari ST (And indeed - most 16 & 32 bit machines)

It was performed on an Atari 520STFM with 1meg of RAM. Using a 300k FAST-RAMdisk for all file operations. Write verify was turned off. No TSR's or ACCessories were loaded.

Results may differ very slightly on some machines. (Speed will obviously increase when being used on accelerated machines)

Comparisons of, ZOO, ZIP, ARC and LHarc are described below. This is using versions, that to my knowledge are the latest versions available to the general public. It is not definitive, but it gives a good idea of which techniques are best to use when you want quick & effective compression - (or slow and in-effective). The results are quite surprising with the popular LHarc coming after both ARC and ZIP in the overall ratings, and being beaten by the default compression mode of ZOO!!

De-compression has not been tested - as times are usually pretty similar in rating.

Text: (181246 bytes)

Time taken:

ZOO (Default) 44 secs
ZIP (Default) 45 secs
ARC 46 secs
ZIP (Deflate) 51 secs
LHarc 74 secs
ZOO (Slow mode) 100 secs

Compression: (% of original size)

ZIP (Deflate) 33.5
LHarc 35
ZOO (Slow mode) 35 (61 bytes bigger than LHarc)
ZIP (Default) 36
ZOO (Default) 41
ARC 41 (739 bytes bigger than Default ZOO)

Binary: (155722 bytes)

Time taken:

ZIP (Default) 36 secs
ZOO (Default) 45 secs
ARC 50 secs
ZIP (Deflate) 61 secs
LHarc 62 secs
ZOO (Slow mode) 90 secs

Compression (% of original size)

ZIP (Deflate) 37
LHarc 38
ZOO (Slow mode) 38 (10 bytes bigger than LHarc)
ZIP (Default) 41
ZOO (Default) 56
ARC 58

The overall ratings - taking into consideration, the time taken,
and the relative compression gained within that time (the total
averages), are as follows:

Speed Compression

The winner: ZIP (Default) 1st 3rd
#2 : ZIP (Deflate) 4th 1st
#3 : ZOO (Default) 3rd 4th
#4 : ARC 2nd 5th
#5 : LHarc 5th 2nd=
Last : ZOO (High compression method) 6th 2nd=

Versions used:

ST-ZIP v2
LHarc v2.01L
ARC v6.02
ZOO v2.14

2179. Diamond Edge Press Release

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 02:06:30 UTC
From: boblu@tekgen.bv.tek.com
Message-ID: <1197@tekgen.bv.tek.com>
Source record: 218196

```
**************************************************************************
* *
* Oregon Research Associates Press Release 8/30/92 *
* *
**************************************************************************
```

Oregon Research Associates is proud to announce the addition of two
new programs to our line of quality Atari ST software:

Diamond Edge and The Ultimate Virus Killer

Diamond Edge
****
Under continual development for two years, Diamond Edge represents
our unwavering commitment to provide the Atari ST community with the
highest quality software and product support available for any computer.
Diamond Edge provides the most advanced set of Disk Management tools
available for the Atari ST:

Disk Diagnostics: Analyzes your disks for critical errors that could lead
to data loss. Complete reporting of all errors found and the affected
files. Assess media integrity and map bad sectors. Assess the integrity
of data on your disk with CRC and checksum validations.

Optimization: Improves disk access. Defragments files and directories,
consolidates free space and optimizes data locations to improve disk
performance. FAST disk disk optimization for reading or writing.
Analyzes disk fragmentation level to assess disk performance.

Repair: Repairs damaged disk structure, damaged files, and maps bad sectors.
Save, restore, edit critical disk information to restore even very badly
damaged disks or recover crashed disks. Assesment and validation of the
integrity of the recovered information.

Data Recovery: The Complete Undelete. The Diamond Mirror system automatically
saves critical disk information that allows you to recover deleted files.
Even undelete fragmented files and subdirectories. Validate the integrity
of the undeleted file. Identifies and recovers data from lost clusters
and unzero's disks.

General Disk Management: A wide variety of powerful disk management and
information tools are available, including hard disk partitioning,
copying, zeroing, wiping, etc.

Diamond Edge defines the new state of the art in disk management,
diagnostics, repair, optimization, and data recovery software for the
Atari ST and is accompanied by a comprehensive spiral bound manual.

A full featured demo is available in file #25511.

Ultimate Virus Killer
****
There are nearly 70 types of virus prevalent on the Atari ST. With this package you can detect, destroy, and protect yourself from virus infection by all known and even unknown viruses.

Scans disks and memory for suspicious system activity. Detects even unknown viruses and calculates a viral contamination probability. Immunizes your disks against future virus attacks. 67 Viruses recognized, immunized, and destroyed. Including the dreaded "link viruses" that attach themselves to every program that runs and can destroy all your data.

Over 1000 executable boot sectors explicitly recognized and nearly 500 repairable. Regularly update to guarentee the best possible virus protection possible. The Ultimate Virus Killer is the ULTIMATE tool to protect your Atari ST from virus infection and is accompanied by a comprehensive printed manual..

****
Diamond Edge is available for the introductory price of only $69.95 and will be released at the Glendale show on September 12, 1992. Existing Diamond Back II owners should contact us for a special limited time offer.

The Ultimate Virus Killer is available for the introductory price of only $29.95 and will be released at the Glendale show on September 12, 1992.

Backup, Diagnostics, Optimization, Repair, Recovery, Virus Prevention: Total disk protection from Oregon Research Associates. On the cutting Edge of Computer Technology.

Additional information can be obtained by contacting us at:

Oregon Research Associates

2180. Re: max baudrate?

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 02:39:25 UTC
From: baffoni@aludra.usc.edu
Message-ID: <la5lutINN2k5@aludra.usc.edu>
Source record: 218198

Hi all,

Two things that I forgot to add in my listing of problems with
connect.
First, when going from reading news (which is ok at 7bit/even parity)
to emacs, it goes back to interpreting 8bit/no parity, so I have to change
the RS232C setings in order to understand what I am emacsing :)

The second thing is that XYZ does not work when run from the
download option. It runs XYZ (it shows the starfall stuff, buffer, etc.)
but then it just sits there - no reaction at all. I left it there for about
five minutes and nothing. Of course when I cancelled XYZ, it cancelled
sz on the host so it puts me back at the system prompt.

Does Connect REQUIRE MiNT to run properly?

-Mike (a frustrated, NON-German-speaking telecommunicator)

2181. Mac Portable vs. ST Portable

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 02:46:20 UTC
From: SML108@psuvm.psu.edu
Message-ID: <92244.224620SML108@psuvm.psu.edu>

Try st_term.lzh at atari.archive.umich.edu in atari/telecomm/. It's PD
and handles Kermit and Xmodem (not to mention Ymodem, Zmodem, Fmodem,
SEAlink, Compu$erve B, and perhaps a few others). However, it's a fairly
old program and isn't at all GEM-based, if that's what you're looking
for. It *DOES* work, though.

> ARC v6.02
> ZOO v2.14

You can use different weighting for the importance of speed
compared to size ! Of course, LHarc is the worse if time is important
as it always uses a slow but quite efficient algo.
If size is more important, on the other hand, it will be 2nd !

One thing is sure: ZIP is the best in this bechmark !

For the rest, you can interpret the result as you wish !
Personnally, I only use archives for their size (to store on
floppy, or just to gain room on my small HD) so that
speed is not really an issue but size is !

If I want to be fast, I just don't compress at all!

2188. C compiler questions.

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 05:41:10 UTC
From: morrison@ee.ualberta.ca
Message-ID: <morrison.715326070@ee.ualberta.ca>
Source record: 218057

I have been playing around with some of the sample programs in "Atari ST: VDI" trying to get into graphical programming. I have compiled programs with Sozobon, GCC2.1, and also translated several of them into assembly. I have no trouble getting the programs to work in assembly, so I have a benchmark of what they are supposed to do when working correctly, but I would like to be able to achieve the same results in C.

Sozobon does not appear to have any provisions for linking in the libraries, so I have been using this technique:

```
> cc prog.c aesfast.a vdifast.a -o prog.prg -v
```

which does work, but seems a bit kludgey to me. Any suggestions about what I can do better/differently. Also, some of the VDI bindings do not seem to work properly...for example, vsm_height. Is this a symptom of vdifast.a? Admittedly, vsm_xxxx are not critical functions, but a full implementation ought to include all existing functions.

GCC works somewhat better, but I am curious abouty the structure of the library files. They have .olb extensions, what does this mean? I notice that .a files (used with Sozobon) are not recognized by GCC. Also, when I link in the 'gem.olb' library, things work fine, but if I link in 'gem16.olb' I get multiple bombs (three). What is going on here?

I can write programs in assembly, but when I just want to get a feel for what the various functions _do_, C is way more convenient. One last question, does anyone know when the latest version of HSC is available, and what is the last version? (And would they recommend its use?)

Source record: 218061
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

LHarc DOES have a 'fast mode' which involves simply 'storing' the files - so, I didn't bother testing it, as for archival purposes, it's use is very limited.

I know that ZOO's lack of speed has been known for a while - and I never said it was a new discovery, I was merely showing it for comparison purposes. Besides, there are always new users out there!

ZIP's compression technique is not Lh5 - it has a completely different technique - which is basically 'Implode' except it tries harder!

Wrong! The DSP has no direct access to main memory. Data are transferred via
a parallel bus at a maximum speed of 1 MB/s.

Rename your libraries to libvdi.a and libaes.a and you
can link them with "-lvdi -laes" . Cc also adds the $LIB
path for you.
You can save more keystrokes if you use ar to unpack both
aes and vdi into a fresh directory and then create one big
library libgem.a . However, linking will be slower if you
need only one of them.

2195. Q: 2nd Drive in Megafile 44

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 09:21:27 UTC
From: roth@sitter.ips.id.ethz.ch
Message-ID: <1992Sep1.092127.25144@bernina.ethz.ch>
Source record: 218062

Ataris Syquest drive, the Megafile 44, seems to be well prepared
to hold a second harddisk drive: it has a free 50 Pin connector
and sufficient power supply. The AHDI 5.0 even sees another ACSI
adress with "no reply".

Anyone build another harddrive into it? What drives can be used?
Does it need terminator resistances as at the first (Syquest)? Need
to set any jumpers? Any info appreciated.

If reply by e-mail (what I would prefer), don't use reply but
send to roth@ips.id.ethz.ch (the from: field is wrong!!).

2196. Problem with Protar drive/TOS 1.2

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 10:02:06 UTC
From: mr3@ukc.ac.uk
Message-ID: <1546@eagle.ukc.ac.uk>
Source record: 218063

I'm posting this for a friend. Reply by email to

cmeli%panther@carla.dist.unige.it

or to me if it bounces back. Thanks.

Mike

Has anyone got a Protar drive (mine is a ProGate 100DC) working with
TOS 1.2? Autobooting results in 2,3 or 11 bombs (even if I insert a
floppy to boot from) while if I copy any file to the hard disk only
the first 1024 bytes are copied correctly (the rest is garbage).
So running programs copied this way results in 2 bombs or a TOS #35
error message. I've tried reformatting & checking for bad sectors
but the drive is physically fine. It's got to be the TOS version.
I thought it could be due to the Protar software writing the FAT
as a 16-bit one so I created a 2.9Meg partition so only a 12-bit
FAT got created. It didn't work still.
The manual states that you have to switch the drive on and wait for
25 seconds, then you switch on the ST. If I do this I get 2,3 or 11
bombs as I stated above. So I first switch on the ST and then the drive
after the ST boots. Then I run BOOT.TTP manually. The version of the
Protar software I have is 4.12 (July 1992) (English version).
Has anyone got it working with TOS 1.2?
I will be upgrading to TOS 2.06, but in the meantime I would like ot
be able to use the drive!

Please reply to me at cmeli%panther@carla.dist.unige.it
or if you can't get through send your message to mr3@ukc.ac.uk
who will forward it to me.

Thanks,

Clyde.

No, no, no, no! I didn't buy an ST so that I could run PC (for example) look alike software on it. If having access to that software is important to you then you should be using a PC. I don't think anyone here honestly sees atari taking on the likes of IBM, much as we'd like them too (more people using your software means more people likely to pay for it), but to suggest that they should just attempt to blend in instead... They're are enough PC clones in the world already, without Atari starting to churn them out.

Kev

I think what Kristopher meant is that the DSP cannot only communicate
via the DSP hostport but also can use the DMA Read/Write Devices. So the
DSP give Data to the DMA device wich put it into main memory. No 030
is involved in that.

Bye,
Alex

2200. Re: The REAL Falcon specs wanted!

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 12:02:11 UTC
From: piet@cs.ruu.nl
Message-ID: <1992Sep1.120211.6162@cs.ruu.nl>
Source record: 218067

I found this file on the local ATARI Company's BBS : (original in Dutch)

This article is written by Wilfred Kilwinger (Support Manager) for
Atari Briefing, the newsletter by Atari (Benelux) B.V. for the Atari
user groups. It was specifically stated that it could be reproduced. I have
translated it in English with the assumption that an English translation
would be considered the same as the original.

The original also contained a description of all the features of the Falcon
which have been reproduced here a zillion of times so I did not include
these.

Atari custom chips

VIDEL

The VIDEL takes care of the video functions of the system including
overscan, overlay mode and true color graphics

COMBEL

The COMBEL is the system manager of the Atari Falcon030. This chip controls
all system functions. Also the BLITTER is built in in this chip.

SDMA

The SDMA is the Sound DMA and controls the sound part. We have built in a
unique matrix switch function in this chip (more details in the second part)

KEYBOARD PROCESSOR

The keyboard processor has been improved and is now also suitable for high
resolution mice.

Besides the above custom chips the Atari Falcon030 has a number of standard
chips like the Motorola 68030 and 56001 DSP. Another important chip is the
CODEC in which the 16 bit AD and DA converters are located.

Video modi

As you can see in the survey of Operating System calls
the video hardware is complete sotware controllable. The following
combinations can a.o. be chosen:

Mode Resolution Bit planes Colors Palette

ST LOW 320x200 4 16 4096
ST MED 640x200 2 4 4096

ST HIGH 640x400 1 2 4096

True Color 640x480 8 256 262144
320x200 15bpp 32768 N/A

The last mode asks for some explanation. Here there is no color palette but
15 bits per pixel to describe the pixel itself. The format is
RRRRRGGGGGXBBBBB. VDI supports this mode thus programs that have not been
written for this mode specifically can use it nevertheless.
X is the overlay bit and can be used for video titling and special effects.

320x200 16bpp 65 N/A

This mode is called the slideshow mode, is not supported by the VDI, you
are on you own. X is an extra green bit.

True Color in 640x480 is not possible because of the bandwidth of VGA monitors.

Mode Resolution Bit planes Colors Palette

VGA 320 of 640 1,4,8 2,16,256 262144 (Overscan
Video 200 of 400

With Video we mean the Atari SC-monitors, the TV modulator and/or the
composite video output.

All modes can be gegenlocked. With adaptors we convert
the 15-pole video bus to thee standard Atari or VGA connections.

Matrix coupling

To make the system performance in the audio part as good as possible Atari
designed a miniature 'telephone exchange' that can easily connect the
source devices to the receiving devices. Also it is possible to make more
than one connection at a time.

De volledige beschrijving van bovenstaande functie's staat in de Falcon030 Developers Documentation.

VIDEO SETMODE

```
int setmode( int modecode );
```

The setmode(int modecode) call is used to place the Falcon/030 SHIFTER into a specific mode. A bit-encoded value (called a "modecode") is passed to setmode() to set the mode. setmode() returns the previous mode that was set.

To help make the building of modecode values easier, here is a table of defines:

```
#define VERTFLAG 0x100
#define STMODES 0x80
#define OVERSCAN 0x40
#define PAL 0x20
#define VGA 0x10
#define TV 0x0

#define COL80 0x08
#define COL40 0x0
#define NUMCOLS 7

#define BPS16 4
#define BPS8 3
#define BPS4 2
#define BPS2 1
#define BPS1 0
```

Using these defines, you can build a modecode for any possible mode. For example:

For True Color Overscan:

```
modecode = OVERSCAN|COL40|BPS16;
```

For ST Medium Compatibility mode on a Color Monitor/TV:

```
modecode = STMODES|COL80|BPS2;
```

For ST Low Compatibility mode in PAL on a Color Monitor/TV:

```
modecode = STMODES|PAL|COL80|BPS2;
```

For 256 color, 80 column mode on a VGA monitor:

```
modecode = VGA|COL80|BPS8;
```

If you have a modecode and wish to know how many bits per pixel it has, use the following:

```
if( modecode & NUMCOLS ) == BPS16 )
do_something_cool(); /* You have true color mode */
```

The setmode() call will return the previous modecode set. You must use this value to get back to whatever mode you were in before you made your setmode call.

```
int mon_type(void)
```

The mon_type() function will return the kind of monitor that is currently in use. Here are the possible return values:

```
0 = ST monochrome monitor
1 = ST color monitor
2 = VGA monitor
3 = Television.
```

```
void ext_sync( int flag )
```

This function sets or clears external sync. If flag is set, external sync is enabled. If flag is clear, then internal sync is used.

SOUND-calls

```
locksnd();
```
Used as a semiphore to lock the sound system. From other applications.

```
unlocksnd();
```
Used to release the sound system for other applications to use.

```
soundcmd(mode,data);
```
This command is used to get or set the following sound parameters. If a negative number is used as the input then the current setting us returned.

MODE OPERATION MEANING

O LTATTEN Sets the current left channel output

1 RTATTEN Sets the current right channel output

2 LTGAIN Sets the current left channel input gain.

3 RTGAIN Sets the current right channel input gain.

4 ADDERIN Set the output of the 16 bit signed adder to receive it's input from the ADC, Matrix or both.

5 ADCINPUT Set the input the the ADC. The input can either be the left and right channel of the PSG or the left and right channel of the microphone.

6 SETPRESCALE Used for compatability. This prescale value is used when the DEVCONNECT() internal prescale value is set to zero.

setbuffer(reg,begaddr,endaddr);
This function is used to set the play or record buffers. REG selects
playback or record, while begaddr and endaddr are the buffers beginning
and ending locations.

(int) reg - (0) Sets playback registers.
- (1) Sets record registers.
(long) begaddr - Sets the beginning address of the buffer.
(long) endaddr - Sets the ending address of the buffer.

setmode(mode);
This function is used to set record or playback mode. The modes are as
follows:

MODE OPERATION
(int) 0 8 Bit Stereo
(int) 1 16 Bit Stereo
(int) 2 8 Bit Mono

settracks(playtracks,rectracks);
This function is used to sets the number of record or playback tracks.

setmontracks(montrack);
This function is used to set the output of the internal speaker to one of
the four tracks currently playing. The internal speaker is only capable of
outputing ONE track at a time.

setinterrupt(src_inter,cause);
This function is used to set which interrupt that will occur at the end of a
frame. If the frame repeat bit is on, this interrupt is used to allow for
double buffering the playing or recording of sound. Interrupts can come from
TimerA or the MFP i7.

buffoper(mode);
This function is used to control the operation of the play or record buffers
in the sound system. The input to this function is a bitmap. If mode is set
t0 -1 then the current status of the buffer operation bits is returned.

NOTE: The sound system contains a 32 byte FIFO. When transferring data to
the record buffer, software MUST check to see if the record enable (RE) bit
was cleared by the hardware. If the bit was cleared then the FIFO is flushed,
if not then software must flush the FIFO by clearing the record enable (RE)
bit.

dsptristate(dspxmit,dsprec);
This function is used to tristate the DSP from the data matrix.

gpio(mode,data);
This is used to communicate over the General Purpose I/O on the DSP connector.
Only the low order three bits are used. The rest are reserved. This call,
depending on the mode, can be used to set the direction of the I/O bits, read
the bits, or write the bits.

devconnect(src,dst,srcclk,prescale,protocol);
This function is used to attach a source device to any of the destination

devices in the matrix. Given a source device, this call will attach that one source device to one or all of the destination devices. This call also sets up the source clock and prescaler, protocol and protocol source if used.

sndstatus(reset);
This function gets the current status of the codec.

buffptr(pointer);
This function returns the current position of the play and record data buffer pointers. These pointers indicate where the data is being read/written within the buffers themselves. This function is also used to determine how much data has been written to the record buffer. See buffoper().

The above is not yet complete. Atari has also routines for
JPEG and andio conversion.

2201. TT Fast-RAM for-sale

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 12:08:50 UTC
From: andre@cix.compulink.co.uk
Message-ID: <memo.603815@cix.compulink.co.uk>
Source record: 218068

alewis@icarus.weber.edu recently offered his 2Mb TT030 for sale here. If anyone is interested in buying that, and adding some more memory to it, I've got an Atari 4Mb Fast-RAM board for sale at a reasonable price. (I'm putting a new, larger, board into my own machine so the old one is now spare). Airmail on such an item from the UK should be fairly cheap.

All the talk concerning the size and spped etc. of different archivers is fine, but in the long run I want to know which of these formats is the most stable. If I go to de-archive some data files 6mos. form now I don't want bad header errors galore...anyone have any facts on reliability of archivers? Maybe you could post if you lost an archive and we could do a very un-scientific poll of archive reliability. BTW, i'd always found .lzh the best for size, until.zoo, and I haven't really looked at .zip.

2205. Dungeon Master Version Numbers

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 13:33:50 UTC
From: os9paul@gkcl.ists.ca
Message-ID: <1992Sep1.133350.17965@ists.ists.ca>
Source record: 218072

I have read that there is more than one version of Dungeon Master and that the end of the earlier version is less interesting/satisfying than that of later version. My questions are:

1. What is the latest version?
2. How do I determine which version I have? I have looked at the box, the label, the docs, and inside the program - I can't find it.
3. What is FTL's policy about upgrading the disk if I have an older version?
4. What is the current address and/or phone number for FTL?

From: imkrause@techfak.uni-bielefeld.de
Message-ID: <1992Sep1.145859.23952@unibi.uni-bielefeld.de>
Source record: 218075

I am posting this for a friend of mine:
He is running a NEC D5 146H harddrive, driven by a OMTI 5527 (20513?)
controller which runs at the DMA-Port.
At this port the laserprinter should run as well and that is the problem.
How is it possible to work with both devices at the same time ?
It would be fine by just changing a device address of the harddrive or
the laserprinter but there is no documentation available to him :-(
If anybody knows how to deal with this, please email to me
instead of posting because i do not read this newsgroup very often.

Thanks,
Michael

Got a Mega 4 ST. Wish it was a Mega STe? :-| Do I *really* want a Falcon/Next?

2210. Line-doubling on the Falcon, is this what it is?

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 18:45:49 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1992Sep1.134551.12462@miavx1.acs.muohio.edu>
Source record: 218078

Well, looking through the latest Video Magazine, I was surprised to see an article on an image enhancing technique for video dubbed line-doubling. Now is this the same as the Falcon's new display modes? If so, this could be one of the best things that Atari could put into the new machine for video production!

The article starts out by comparing line-doubling to HDTV, but is possible now, but for a lot of money. (Most of the set-ups described in the article cost >$30000. (Yes, thats Thirty thousand dollars.)

Here is how they describe line-doubling, taken without permission from VIDEO magazine:

"... A Line doubler memorizes the first (odd) half of the 525 lines [of NTSC video signal] while simultaneously displaying the other(even) half. This adds up to a full frame of video every 1/60th of a second, instead of every 1/30th. Since you're now seeing both halves of the video image on screen at the same time, the picture "looks" more detailed, even thoiugh you're not really seeing more information than is actually present in the source material. Just as importantly, the scan lines become almost imperceptible."

Is this the same mode as line-doubling on the Falcon? If so, the falcon could produce awesome video productions, for a lot less money.

This would only occur on Xmodem protocols, because Ymodem and Zmodem
protocols get the filenames from the other end. When you're uploading,
FZDT makes a file containing the batch list of files to send (at least
my FZDS is set up to do so). I'm not sure if it then puts the entire
batch list on the command line, but I don't thinks so, why then bother
to even create the batch list?

> Later.......

No: it is not the same as the line-doubling on the falcon cause
what you describe is related to picture displaying and not to
picture generation. That is: it's a monitor (or TV) trick but
not a computer (or broadcasting) trick !

The Falcon line-doubling, is just a kind of x2 zoom in y dimension
and works only on correspondingly powerful monitors: that means all
VGA monitors but surely not TV-sets !

Your trick is a way to inhence TV-refresh rate, Falcon's is a way
to use lower resolutions on too powerful monitors !

Stefan Monnier

> --

If anyone is interested, I was able to get it to work under the Olivetti and EGA mono video modes. I just doesn't seem to like the VGA mono mode. This seems somewhat odd, as during the Windows Setup program, it starts Windows, and it runs just fine in the VGA mode. But then when I try to run Windows by itself, it just shows a messed up title screen and then hangs up (when I install it in the VGA mono mode). Has anybody else gotten it to work in VGA mode? Also, under windows, the keyboard mapping seems a little screwy. For me, the key with the backslash and vertical bar no longer registered anything, and these characters registered on the key that has the tilde and backward single quote. It acted the same for thecouple keyboard configurations that I tried. Does anybody know what type of keyboard AT-Speed emulates? Anyway, Windows 3.1 does work under AT-Speed, and it even seems to run at a pretty usable speed. Ciao.

Doug Tarico
dtarico@ccit.arizona.edu Where's it gonna get you when

NAME: comp.graphics.gnuplot

CHARTER:
1) This group is for the discussion of the GNUPLOT plotting program by
developers and users.
2) This group will be gatewayed with a mailing list (if someone volunteers
to maintain it).
3) An FAQ list will be maintained.
4) GNUPLOT is a command-driven interactive function plotting program which:
a) Plots data or functions
b) Has been tested on Unix, VMS, MSDOS, MS-Windows, OS/2, Amiga, and
Atari platforms
c) Supports many different graphics devices
d) Is authored by Thomas Williams, Colin Kelley, Russell Lang,
Dave Kotz, John Campbell, Gershon Elber, and many others
e) Is not part of the GNU project.

STATUS: Unmoderated

It only seems terrible until you try WordPerfect for Windows. After
that, you'll run yelling and screaming back to DOS WordPerfect :-) :-)
:-)

The best known (and as far as I know the biggest) atari ftp-archive is
atari.archive.umich.edu. In the 'atari' directory you find tons of software.
And about chatting with fellow atariSTs: what about this newsgroup - lots of
expertise here (and, really, most of these guys are quite friendly :).

welcome to ST-land,
Hendrik Jan

>one get one for and how good are they compared to the mac portable?

^$5000??? Where are you looking at Mac laptops? The top of the line Mac notebook, the PB170, costs under $3500 and you can get a PB145 for under $2000. Since the ST Book is still not available anywhere but in Europe, that's not really an option (besides, Spectre GCR won't run on the ST Book yet). However, you *CAN* find Stacy portables for under $1500 that the Spectre GCR will run on, although it's a little less portable with the big Spectre GCR cartridge in it. So if you're friend doesn't mind that and doesn't mind having a machine that only lasts 15-20 minutes on a battery charge (actually, there's a new 2 hour battery for the Stacy which costs around $75), then the Stacy/Spectre GCR *IS* an option. It's not really a 'laptop' mind you, but it *IS* portable. Personally, I like the Stacy a lot since I would only need a portable computer and would never be using the battery. The ST Book notebooks, which are currently under some redesigning, should be available by early '93 in the rest of the world, though there's still no word on a Spectre GCR adaptor for it or even a specially-designed Spectre GCR for the ST Book.

>version of bash and microemacs; I compiled these for the plain unix
>version (which works fine and is nicer than the TOS versions).

I haven't seen any mention of this bug before, bummer...

By the way, since the .95 release, there have been 3 more patches sent out -
the one I mentioned above, and two more bringing it to version 0.96,
patch level 1. Dunno when a binary for these will be made available.

2221. Re: AT-Speed and Windows 3.1? (2nd try)

Newsgroup: comp.sys.atari.st
Date: 1992-09-01 23:33:19 UTC
From: kjohnson@castor.cs.uga.edu
Message-ID: <1992Sep1.233319.10304@athena.cs.uga.edu>
Source record: 218088

I thought Windows 3.1 required at least a '386 to run? The AT-Speed C16 *IS* only a 16MHz '286, right? Maybe that's the problem. Only Windows 2.x will work on a '286, I believe.

Message-ID: <1992Sep1.234237.10652@athena.cs.uga.edu>
Source record: 218089

According to Bill Rehbock, Director of Application S/W @ Atari, the Falcon030 is in a light-grey case like the 1040ST's and that the keys are a darker grey with white lettering. I was pulling for the black (very dark-grey) case, but I apparently lost.

```
One last thing on your make problem:

You do have the dependency for the executable, don't you? e.g.

OBJECTS = foo.o bar.o

foo: $(OBJECTS)
$(CC) $(CFLAGS) -o foo $(OBJECTS) $(LIBS)

or something like that (all symbols previously defined)

That article came from Europe. In europe the Ataris biggest compeition is the Amiga. The article makes sense with Atari not being able to market the Falcon properly. I talked to a few people who work at EA and they are pissed at the way Atari handled the Lynx. THey said that they could have outsold Nintendo Gameboy by now. I even talked to a guy working at Atari in Toronto and they said that Atari doesn't have to money to mass produce the Links the way they would like too.

As far as the Atari Falcon being Ataris last chance. Do you know how many Atari employees are working in Canada? 3!

The 8n1/7e1 thing is EMACS's problem. I have run into exactly the same thing with a board that I connected to at 7e1. Apparently EMACS only runs in 8n1 mode. I also found 'sz' and 'rz' wanted 8n1 as well. If you are running a shell account (I presume?) you could do a stty -evenp after you log on, then change your term program to 8n1 and you will be in 8n1 for everything. A pain, but better than using VI !!!!

Is this the first term program you have tried? Have you tried Freeze Dried?

Apparently there is an ENGLISH version of Connect in circulation. As far as the program anyway (or is this what you have now?). I gave up on trying to get it run. I find Freeze Dried great (although I'm only running 2400).

2226. .dl, .gl, .fli files/ viewers

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 01:22:38 UTC
From: Mike Stramba <stramba@zooid.guild.org>
Message-ID: <1992Sep2.012238.14001@zooid.guild.org>
Source record: 218098

1) Are .gl, .dl, .fli files three completely incompatible file types?

What are the differences ?
Each need their own viewer?

2) Are there any viewer programs for the Atari ST?
(for any/all of these file types?

Or anybody have source/docs on these file types?

There was a recent .dl viewer source for X-Windows, but it seemed to be
incomplete.

2227. X-Control Problem and Request

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 03:39:23 UTC
From: jreiss@magnus.acs.ohio-state.edu
Message-ID: <1992Sep2.033923.9111@magnus.acs.ohio-state.edu>
Source record: 218092

Hello.

Quite a long while back, I pulled xcontrol.arc off of atari.archive.
It piddled with it a bit, then tucked it away in an obscure part of my
hard disk. Recently I came back to it. And I realized why I tucked
it away. For one reason or another, my modem.cpx bombs when I
activate it. And I seem to recall a discussion of this when xcontrol
was first made available.

Anyway, what I'm wondering is if some kind soul would please e-mail me
a working copy of this cpx, or point me towards an ftp site and file
name where I might find it. If you can help, please reply via e-mail
as I'll be away from my account for a while over break and I don't
want to wade through a ton of news when I get back.

Thanks in advance.
Joe

2228. Atari Canada has vanished!!!

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 03:43:07 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <1SEP92.23430763@cc4.crl.aecl.ca>
Source record: 218093

On Monday August 31st, Bell Canada advised me that Atari Canada disconnected its phone lines. I called Atari USA in Calif and was told it still did not know when it would ship product to Canada.

I was told that someone would call me but so far no one has contacted me from Atari USA.

As a dealer I am really ticked off; after years of flogging Atari products the damn company just pulls the plug on the local operation and leaves me wondering what will happen next.

Right now, I am not so concerned about the FALCON as I am with the actual survival of Atari as a company. I certainly would not pre-pay for any stock since I believe my company is less of a credit risk than Atari!!!

I hope someone from Atari makes a statement on all this pretty soon to clarify what Atari USA intends to do to help its Canadian dealers.

2229. VT100 Codes for all!

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 06:01:05 UTC
From: wilsont@orac.holonet.net
Message-ID: <Btxspt.5H0@iat.holonet.net>
Source record: 218096
Body handling: HTML body converted to readable text

yes.. you all asked for it (well at least 10...)
here are the ansi vt100 codes for cursor control.
it is somwhat edited, since a lot was DEC specific and other stuff.
if you want the whole file.. just mail me
but this is the good stuff:

This file describes information needed for controlling the VT100 terminal from
a remote computer. All of the information was derived from the VT100 user's
manual, Programmer's Information section. Full documentation can be obtain
from DIGITAL'S Accessory and Supplies Group.

ANSI mode w/cursor ANSI mode w/cursor
Cursor Key VT52 mode key mode reset key mode set

UP A [A OA
DOWN B [B OB
RIGHT C [C OC
LEFT D [D OD

```
*******************************
* Special Graphics Characters *
*******************************
```

If the Special Graphics set is selected, the graphics for ASCII codes
0137 through 0176 will be replaced according to the following table (see the
SCS control sequence).

Octal ASCII Special Octal ASCII Special
Code graphic graphic code graphic graphic

0137 _ Blank 0157 o Horiz Line - scan 1
0140 \ Diamond 0160 p Horiz Line - scan 3
0141 a Checkerboard 0161 q Horiz Line - scan 5
0142 b Digraph: HT 0162 r Horiz Line - scan 7
0143 c Digraph: FF 0163 s Horiz Line - scan 9
0144 d Digraph: CR 0164 t Left "T" (|-)
0145 e Digraph: LF 0165 u Right "T" (-|)
0146 f Degree Symbol 0166 v Bottom "T" (|_)
0147 g +/- Symbol 0167 w Top "T" (T)
0150 h Digraph: NL 0170 x Vertical Bar (|)
0151 i Digraph: VT 0171 y Less/Equal (<_)
0152 j Lower-right corner 0172 z Grtr/Egual (>_)
0153 k Upper-right corner 0173 { Pi symbol
0154 l Upper-left corner 0174 | Not equal (=/)
0155 m Lower-left corner 0175 } UK pound symbol

0156 n Crossing lines (+) 0176 ~ Centered dot

NOTE 1: Codes 0152-0156 and 0164-0170 are used to draw rectangular grids" each piece of this set is contiguous with other so the lines formed will be unbroken.

NOTE 2: Codes 0157-0163 give better vertical resolution than dashes and underlines when drawing graphs; using these segments, 120 x 132 resolution may be obtained in 132 column mode with the Advanced Video Option installed.

****
* Terminal Control Commands *
****

Control Characters

The control characters recognized by the VT100 are listed below. All other control characters cause no action to be taken.

Control characters (codes 00 - 037 inclusive) are specifically excluded from the control sequence syntax, but may be embedded within a controlsequence. Embedded control characters are executed as soon as they are encountered by the VT100. The processing of the control sequence then continues with the next character recieved. The exceptions are: if the character occurs, the current control sequence is aborted, and a new one commences beginning with the just recieved. If the character (030) or the character (032) occurs, the current control sequence is aborted. The ability to embed control characters allows the synchronization characters XON and XOFF to be interpreted properly without affecting the control sequence.

Control Octal
Character Code Action Taken

0000 Ignored on input; not stored in buffer
0005 Transmit ANSWERBACK message
0007 Sound bell
0010 Move cursor to the left one position, unless it is at the left margin, in which case no action is taken.
0011 Move cursor to the next tab stop, or to the right margin if no further tabs are set.
0012 Causes either a line feed or new line operation (See new line mode.)
0013 Same as .
0014 Same as .
0015 Move the cursor to the left margin of the current line.
0016 Invoke the G1 character set, as designated by the SCS control sequence.
0017 Invoke the G0 character set, as selected by the (sequence.
0021 Causes terminal to resume transmission (XON).
0023 Causes terminal to stop transmitting all codes except XOFF and XON (XOFF).
0030 If sent during a control sequence, the sequence id

immediately terminated and not executed. It also
causes the error character (checkerboard) to be
displayed.
0032 Same as .
0033 Introduces a control sequence.
0177 Ignored on input; not stored in buffer.

The VT100 is an upward and downward software compatible terminal; that is, previous DIGITAL video terminals have DIGITAL's private standards for control sequences. The American National Standards Institute has since standardized escape and control sequences in terminals in documents X3.41-1974 and X3.64-1977.

The VT100 is compatible with both the previous DIGITAL standard and ANSI standards. Customers may use existing DIGITAL software designed around the VT52 or new VT100 software. The VT100 has a "VT52 compatible" mode in which the VT100 responds to control sequences like a VT52. In this mode, most of the new VT100 features cannot be used.

Throughout this document references will be made to "VT52 mode" or "ANSI mode". These two terms are used to indicate the VT100's software compatibility.

NOTE: The ANSI standards allow the manufacturer flexibility in implementing each function. This document describes how the VT100 will respond to the implemented ANSI central function.

NOTE: ANSI standards may be obtained by writing:

American National Standards Institute
Sales Department
1430 Broadway
New York, NY, 10018

Definitions

Control Sequence Introducer (CSI) - An escape sequence that provides supplementary controls and is itself a prefix affecting the interpretation of a limited number of contiguous characters.
In the VT100, the CSI is: [

Parameter: (1) A string of zero or more decimal characters which represent a single value. Leading zeros are ignored. The decimal characters have a range of 0 (060) to 9 (071).
(2) The value so represented.

Numeric Parameter: A parameter that represents a number, designated by Pn.

Selective Parameter: A parameter that selects a subfunction from a specified set of subfunctions, designated by Ps. In general, a control sequence with more than one selective parameter causes the same effect as several control sequences, each with one selective parameter, e.g., CSI Psa; Psb; Psc F is identical to

CSI Psa F CSI Psb F CSI Psc F.

Parameter String: A string of parameters separated by a semicolon.

Default: A function-dependent value that is assumed when no explicit value, or a value of 0, is specified.

Final character: A character whose bit combination terminates an escape or control sequence.

EXAMPLE: Control sequence to turn off all character attributes, then turn on underscore and blink attributes (SGR). [0;4;5m

Sequence:

Delimiters
/ \
/ \
| |
\ / \ /
[0 ; 4 ; 5 m
^^^^^^ ^ ^ ^ ^
|||||| | | | |
\|||||/ \ | / +------Final character
\|||/ \ | /
CSI Selective
Parameters

The octal representation of this string is:

033 0133 060 073 064 073 065 0155
[0 ; 4 ; 5 m

Alternate sequences which will accomplish the same thing:

1) [;4;m

2) [m
[4m
[5m

3) [0;04;005m

Control Sequences

All of the following control sequences are transmitted from the Host to VT100 unless otherwise noted. All of the control sequences are a subset of those defined in ANSI X 3.64 1977 and ANSI X 3.41 1974.

The following text conforms to these formatting conventions:

1) Control characters are designated by angle brackets (e.g. the Escape character is).

2) Parameters are indicated by curly braces.

3) Parameter types usually are indicated as one of:

{Pn} A string of digits representing a numerical
value.

{Ps} A character that selects an item from a list.

{a-z} Any lowercase sequence of one44 or more
characters in braces represent a value to be
entered (as in {Pn}), and the name in the
braces will be referred to in explanatory text.

4) Spaces in the control sequence are present for clarity and
may be omitted. Spaces which are required will be
surrounded by single quotes: ' '.

5) All other characters are literals.

CPR Cursor Position Report VT100 to Host

[{Pn} ; {Pn} R Default Value: 1

The CPR sequence reports the active position by means of the
parameters. This sequence has two parameter values, the first
specifying the line and the second specifying the column. The default
condition with no parameters present, or parameters of 0, is equivelent
to a cursor at home position.

The numbering of the lines depends upon the state of the Origin Mode
(DECOM).

This control sequence is sent in reply to a device status report (DSR)
command sent from the host.

CUB Cursor Backward Host to VT100 & VT100 to Host

[{Pn} D Default Value: 1

The CUB sequence move the cursor to the left. The distance moved is
determined by the parameter. If the parameter missing, zero, or one,
the cursor is moved one position. The cursor cannot be moved past the
left margin. Editor Function.

CUD Cursor Down Host to VT100 & VT100 to Host

[{Pn} B Default value: 1

Moves the cursor down a number of lines as specified in the parameter
without changing columns. The cursor cannot be moved past the bottom
margin. Editor Function.

CUF Cursor Foreward Host to VT100 & VT100 to Host

[{Pn} C Default Value: 1

The CUF sequence moves the cursor to the right a number of positions
specified in the parameter. The cursor cannot be moved past the right

margin. Editor Function.

CUP Cursor Position

[{Pn} ; {Pn} H Default Value: 1

The CUP sequence moves the curor to the position specified by the parameters. The first parameter specifies the line, and the second specifies the column. A value of zero for either line or column moves the cursor to the first line or column in the display. The default string (H) homes the cursor. In the VT100, this command behaves identically to it's format effector counterpart, HVP.

The numbering of the lines depends upon the state of the Origin Mode (DECOM). Editor Function.

CUU Cursor Up Host to VT100 & VT100 to Host

[{Pn} A Default Value: 1

Moves the cursor up without changing columns. The cursor is moved up a number of lines as indicated by the parameter. The cursor cannot be moved beyond the top margin. Editor Function.

DA Device Attributes Host to VT100 & VT100 to Host

[{Pn} c Default Value: 0

1) The host requests the VT100 to send a DA sequence to indentify itself. This is done by sending the DA sequence with no parameters, or with a parameter of zero.

2) Response to the request described above (VT100 to host) is generated by the VT100 as a DA control sequencewith the numeric parameters as follows:

Option Present Sequence Sent

No options [?1;0c
Processor Option (STP) [?1;1c
Advanced Video Option (AVO) [?1;2c
AVO and STP [?1;3c
Graphics Option (GPO) [?1;4c
GPO and STP [?1;5c
GPO and AVO [?1;6c
GPO, ACO, and STP [?1;7c
<<<<<<<<<<<<<<<<<<<<<<<<<<<<>>>

This command causes the VT100 to fill it's screen with uppercase Es for screen focus and alignment.

DECANM ANSI/VT52 Mode (DEC Private)

This is a private parameter to the SM and RM control sequences. The reset state causes only VT52 compatible escape sequences to be recognized. The set state causes only ANSI compatible escape sequences to be recognized. See the entries for MODES, SM, and RM.

DECARM Auto Repeat Mode (DEC Private)

This is a private parameter to the SM and RM control sequences. The reset state causes no keyboard keys to auto-repeat, the set state causes most of them to. See MODES, SM, and RM.

DECAWM Autowrap Mode (DEC Private)

This is a private parameter to the SM and RM control sequences. The reset state prevents the cursor from moving when characters are recieved while at the right margin. The set state causes these characters to advance to the next line, causing a scroll up if required and permitted. See MODES, SM, and RM.

DECCKM Cursor Keys Mode (DEC Private)

This is a private parameter to the SM and RM control requences. This mode is only effective when the terminal is in keypad application mode (DECPAM) and the ANSI/VT52 mode (DECANM) is set. Under these conditions, if this mode is reset, the cursor keys will send ANSI cursor control commands. If setm the cursor keys will send application function commands (See MODES, RM, and SM).

DECCOLM Column Mode (DEC Private)

This is a private parameter to the SM and RM control sequences. The reset state causes an 80 column screen to be used. The set state causes a 132 column screen to be used. See MODES, RM, and SM.

DECDHL Double Height Line (DEC Private)

Top Half: #3
Bottom Half: #4

These sequences cause the line containing the cursor to become the top or bottom half of a double-height, double width line. The sequences should be used in pairs on adjacent lines with each line containing the same character string. If the line was single width single height, all characters to the right of the center of the screen will be lost. The cursor remains over the same character position, unless it would be to the right of the right margin, in which case it is moved to the right margin.

DECDWL Double Width Line (DEC Private)

#6

This causes the line that contains the cursor to become double-width single height. If the line was single width, all characters ro the right of the center of the screen will be lost. The cursor remains over the same character position, unless it would be to the right of the right margin, in which case it is moved to the right margin.

DECID Identify Terminal (DEC Private)

Z

This sequence causes the same response as the DA sequence. This sequence will not be supported in future models.

DECINLM Interlace Mode (DEC Private)

This is a private parameter to the RM and SM control sequences. The reset state (non-interlace) causes the video processor to display 240 scan lines per frame. The set state causes the video processor to display 480 scan lines per screen. See MODES, RM, and SM.

DECKPAM Keypad Application Mode (DEC Private)

=

The auxiliary keypad keys will transmit control sequences.

DECKPNM Keypad Numeric Mode (DEC Private)

>

The auxiliary keypad keys will send ASCII codes corresponding to the characters engraved on their keys.

DECLL Load LEDs (DEC Private)

[{Ps} q Default Value: 0

Load the four programmable LEDs on the keyboard according to the prameter(s).

Parameter Meaning

0 Clear All LEDs
1 Light L1
2 Light L2
3 Light L3
4 Light L4

DECOM Origin Mode (DEC Private)

This is a private parameter to SM and RM control sequences. The reset state causes the origin (or home position) to be the upper left character position of the screen. Line and column numbers are, therefore, independent of current margin settings. The cursor may be positioned outside the margins with a cursor position (CUP) or horizontal and vertical position (HVP) control.

The set state causes the origin to be at the upper left character position within the current margins. Line and column numbers are, therefore, relative to the current margin settings. The cursor cannot be positioned outside of the margins.

The cursor is moved to the new home position when this mode is set or reset. Lines and columns are numbered consecutively, with the origin being line 1, column 1.

DECRC Restore Cursor (DEC Private)

8

This sequence causes the previously saved cursor position, graphic rendition, and character set to be restored.

DECREPTPARM Report Terminal Parameters VT100 to Host

[{sol} ; {par} ; {nbits} ; {xspd} ; {rspd} ; {cmul} ; {flags} x

This sequence is generated by the VT100 to notify the host of the status of selected terminal parameters. The status sequence may be sent when requested by the host (via DECREQTPARM) or at the terminal's discretion. On power up or reset, the VT100 is inhibited from sending unsolicited reports.

The meanings of the sequence paramters are:

Parameter Value Meaning

{sol} 1 This message is a report.
2 This message is a report, and the terminal is
only reporting on request.

{par} 1 No parity set
4 Parity set and odd
5 Parity set and even

{nbits} 1 8 bits per character
2 7 bits per character

{xspd} 0 Speed set to 50 bps
-and- 8 Speed set to 75 bps
{rspd} 16 Speed set to 110 bps
24 Speed set to 134.5 bps
{xspd}= 32 Speed set to 150 bps
Transmit 40 Speed set to 200 bps
Speed 48 Speed set to 300 bps
56 Speed set to 600 bps
{rspd}= 64 Speed set to 1200 bps
Recieve 72 Speed set to 1800 bps
Speed 80 Speed set to 2000 bps
88 Speed set to 2400 bps
96 Speed set to 3600 bps
104 Speed set to 4800 bps

112 Speed set to 9600 bps
120 Speed set tp 19200 bps

{cmul} 1 The bit rate multiplier is 16

{flags} 0-15 This value communicates the four switch values
in block 5 of SET-UP B, which are only visible
to the user when an STP option is installed.

DECREQTPARM Request Terminal Parameters

[{Ps} x

The host sends this sequence to request the VT100 to send a DECREPTPARM sequence back. {Ps} can be either 0 or 1. If 0, the terminal will be allowed to send unsolicited DECREPTPARMs. These reports will be generated each time the terminal exits the SET-UP mode. If {Ps} is 1, then the terminal will only generate DECREPTPARMs in response to a request.

DECSC Save Cursor (DEC Private)

7

Causes the cursor position, graphic rendition, and character set to be saved. (See DECRC)

DECSCLM Scrolling Mode (DEC Private)

This is a private parameter to RM and SM control sequences. The reset state causes scrolls to "jump" instantaneuously one line at a time. The set state causes the scrolls to be "smooth", and scrolls at a maximum rate of siz lines/sec. See MODES, RM, and SM.

DECSCNM Screen Mode (DEC Private)

This is a private parameter to RM and SM control sequences. The reset state causes the screen to be black with white characters; the set state causes the screen to be white with black characters. See MODES, RM, and SM.

<<<>>>
DECSTBM Set Top and Bottom Margins (DEC Private)

[{Pn} ; {Pn} r Default Values: See Below

This sequence sets the top and bottom margins to define the scrolling region. The first parameter is the line number of the first line in the scrolling region; the second parameter is the line number of the bottom line of the scrolling region. Default is the entire screen (no margins). The minimum region allowed is two lines, i.e., the top line must be less than the bottom. The cursor is placed in the home position (See DECOM).

DECSWL Single-width Line (DEC Private)

#5

This causes the line which contains the cursor to become single-width,
single-height. The cursor remains on the same character position.
This is the default condition for all new lines on the screen.

DECTST Invoke Confidence Test

[2 ; {Ps} y

Ps is the parameter indicating the test to be done. It is computed by
taking the weight indicated for each desired test and adding them
together. If Ps is 0, no test is performed but the VT100 is reset.

Test Weight

POST (ROM checksum, RAM NVR, keyboardm and AVO) 1
Data Loop Back (Loopback connector required) 2
EIA Modem Control Test (Loopback connector req.) 4
Repeat Testing until failure 8

DSR Device Status Report Host to VT100 & VT100 to Host

[{Ps} n

Requests and reports the general status of the VT100 according to the
following parameters:

Parameter Meaning

0 Response from VT100 - Ready, no faults detected
3 Response from VT100 - Malfunction Detected
5 Command from host - Report Status (using a DSR control
sequence)
6 Command from host - Report Active Position (using a CPR
sequence)

DSR with a parameter of 0 or 3 is always sent as a response to a
requesting DSR with a parameter of 5.

ED Erase in Display

[{Ps} J Default: 0

This sequence erases some or all of the characters in the display
according to the parameter. Any complete line erased by this sequence
will return that line to single width mode. Editor Function.

Parameter Meaning

0 Erase from the cursor to the end of the screen.
1 Erase from the start of the screen to the cursor.
2 Erase the entire screen.

EL Erase in Line

[{Ps} K Default: 0

Erases some or all characters in the active line, according to the parameter. Editor Function.

Parameter Meaning

0 Erase from cursor to the end of the line.
1 Erase from the start of the line to the cursor.
2 Erase the entire line.

HTS Horizontal Tab Set

H

Set a tab stop at the current cursor position. Format Effector.

HVP Horizontal and Vertical Position

[{Pn} ; {Pn} f

Moves the cursor to the position specified by the parameters. The first parameter specifies the line, and the second specifies the column. A parameter of 0 or 1 causes the active position to move to the first line or column in the display. In the VT100, this control behaves identically with it's editor counterpart, CUP. The numbering of hte lines depends upon the state of the Origin Mode (DECOM). Format Effector.

IND Index

D

This sequence causes the cursor to move downward one line without changing the column. If the cursor is at the bottom margin, a scroll up is performed. Format Effector.

LNM Line Feed/New Line Mode

This is a parameter to SM and RM control sequences. The reset state causes the interpretation of the character to imply only vertical movement of the cursor and causes the RETURN key to send the single code . The set state causes the character to imply movement to the first position of the following line, and causes the RETURN key to send the code pair . This is the New Line option.

This mode does not affect the Index (IND) or the next line (NEL) format effectors.

MODES The Following is a list of VT100 modes which may be changed with Set Mode (SM) and Reset Mode (RM) controls.

ANSI Specified Modes

Parameter Mnemonic Function

0 Error (Ignored)
20 LNM Line Feed/New Line Mode

DEC Private Modes

If the first character in the parameter string is ? (077), the parameters are interpreted as DEC private parameters according to the following:

Parameter Mnemonic Function

0 Error (Ignored)
1 DECCKM Cursor Key
2 DECANM ANSI/VT52
3 DECCOLM Column
4 DECSCLM Scrolling
5 DECSCNM Screen
6 DECOM Origin
7 DECAWM Auto Wrap
8 DECARM Auto Repeat
9 DECINLM Interlace

Any other parameter values are ignored.

The following modes, which are specified in the ANSI standard, may be considered to be permanently set, permanently reset, or not applicable, as noted.

Mnemonic Function State

CRM Control Representation Reset
EBM Editing Boundary Reset
ERM Erasure Set
FEAM Format Effector Action Reset
FETM Format Effector Transfer Reset
GATM Guarded Area Transfer NA
HEM Horizontal Editing NA
IRM Insertion-replacement Reset
KAM Keyboard Action Reset
MATM Multiple area transfer NA
PUM Positioning Unit Reset
SATM Selected Area Transfer NA
SRTM Status Reporting Transfer Reset
TSM Tabulation Stop Reset
TTM Transfer Termination NA
VEM Vertical Editing NA

NEL Next Line

E

This cuases the cursor to move to the first position of the next line down. If the cursor is on the bottom line, a scroll is performed. Format Effector.

RI Reverse Index

M

Move the cursor up one line without changing columns. If the cursor is on the top line, a scroll down is performed.

RIS Reset to Initial State

c

Resets the VT100 to the state is has upon power up. This also causes the execution of the POST and signal INT H to be asserted briefly.

RM Reset Mode

[{Ps} ; {Ps} l

Resets one or more VT100 modes as specified by each selective parameter in the parameter string. Each mode to be reset is specified by a separate parameter. See MODES and SM.

SCS Select Character Set

The appropriate D0 and G1 character sets are designated from one of the five possible sets. The G0 and G1 sets are invokedd by the characters and , respectively.

G0 Sets G1 Sets
Sequence Sequence Meaning

(A)A United Kingdom Set
(B)B ASCII Set
(0)0 Special Graphics
(1)1 Alternate Character ROM
Standard Character Set
(2)2 Alternate Character ROM
Special Graphics

The United Kingdom and ASCII sets conform to the "ISO international register of character sets to be used with escape sequences". The other sets are private character sets. Special graphics means that the graphic characters fpr the codes 0137 to 0176 are replaced with other characters. The specified character set will be used until another SCS is recieved.

SGR Select Graphic Rendition

[{Ps} ; {Ps} m

Invoke the graphic rendition specified by the parameter(s). All following characters transmitted to the VT100 are rendered according to the parameter(s) until the next aoccurrence of an SGR. Format Effector.

Parameter Meaning

0 Attributes Off
1 Bold or increased intensity
4 Underscore

5 Blink
7 Negative (reverse) image

All other parameter values are ignored.

Without the Advanced Video Option, only one type of character attribute is possible, as determined by the cursor selection; in that case specifying either underscore or reverse will activate the currently selected attribute.

SM Set Mode

{Ps} ; {Ps} h

Causes one or more modes to be set within the VT100 as specified by each selective parameter string. Each mode to be set is specified by a seperate parameter. A mode is considered set until it is reset by a Reset Mode (RM) control sequence. See RM and MODES.

TBC Tabulation Clear

[{Ps} g

If the parameter is missing or 0, this will clear the tab stop at the cursor's position. If it is 3, this will clear all of the tab stops. Any other parameter is ignored. Format Effector.

------*** Cut here ***----

Enjoy!

Paul Good asked a number of questions about Dungeon Master:

As far as I know, the ending of all the ST and Amiga versions
are exactly the same. The IBM PC version has a GREATLY improved
ending animation where the Grey Lord destroys the Firestaff and
the people of the village of Viborg dance in the streets..
VERY nice..!

I'm not sure what the last version of the ST version was.. the
way to check which version number you have is to boot up the
game, then click on the disk icon.. the frame of the dialogue
box (where you can Save, Format, etc) has the version number
on it.

FTL will upgrade the game for a nominal fee.. best to call them
and ask about the newest version number and what their upgrade
procedure currently is..

Their phone number is: (619) 453-5711

> following message.
>
> >>> Pure Lisp storage exhausted

You need to get the compiled LISP files (*.elc). The default size of the
`pure' storage area is too small for the non-compiled files.
Alternatively, rebuild EMACS with a much bigger PURESIZE parameter and compile
those files yourself (that's what I did, and it wasn't fun ...).

In article <RALPH.92Sep1191839@orion.laas.fr> ralph@laas.fr (Ralph P. Sobek) writes:
>I think that Jeff Poskanzer's PBM package does this!

No. PBM is ``Portable Bit Map'' and the package does just that, converts
bit maps. These are the related files from MAN.

brushtopbm(1), cmuwmtopbm(1), g3topbm(1), gemtopbm(1), icon-
topbm(1), macptopbm(1), mgrtopbm(1), pi3topbm(1),
xbmtopbm(1), ybmtopbm(1), pbmto10x(1), pbmtoascii(1),
pbmtobbnbg(1), pbmtocmuwm(1), pbmtoepson(1), pbmtog3(1),
pbmtogem(1), pbmtogo(1), pbmtoicon(1), pbmtolj(1),
pbmtomacp(1), pbmtomgr(1), pbmtopi3(1), pbmtoplot(1),
pbmtoptx(1), pbmtox10bm(1), pbmtoxbm(1), pbmtoybm(1), pbmto-
zinc(1), pbmlife(1), pbmmake(1), pbmmask(1), pbmpaste(1),
pbmreduce(1), pbmtext(1), pbmupc(1), pnm(5), pgm(5), ppm(5)

ghostscript should do what you want. It is capable of converting to a
variety of formats (I don't know them all) but ppm is one of them which
gives you:

giftoppm(1), gouldtoppm(1), ilbmtoppm(1), imgtoppm(1),
mtvtoppm(1), pcxtoppm(1), pgmtoppm(1), pi1toppm(1), pict-
toppm(1), qrttoppm(1), rawtoppm(1), rgb3toppm(1),
spctoppm(1), sputoppm(1), tgatoppm(1), ximtoppm(1),
xpmtoppm(1), ppmtogif(1), ppmtoicr(1), ppmtoilbm(1),
ppmtopcx(1), ppmtopgm(1), ppmtopi1(1), ppmtopict(1),
ppmtops(1), ppmtopuzz(1), ppmtorgb3(1), ppmtouil(1),
ppmtoxpm(1), ppmhist(1), ppmmake(1), ppmpat(1), ppmquant(1),
ppmquantall(1), ppmrelief(1), pnm(5), pgm(5), pbm(5)

Now the only question is what is available for the ST?

John

2236. Looking for a complete discription of the IMG format for the atari st.

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 12:25:44 UTC
From: marcelm@maestro.htsa.aha.nl
Message-ID: <1992Sep2.122544.15695@htsa.aha.nl>
Source record: 217903
Cross-posted to: comp.sys.atari.st,comp.sys.atari.tech

Hi,

is there anybody who can help me with the complete discription of the
IMG picture format for the atari st?
I've bought a book about bit-mapped graphics wich explains about this format,
but the format for the PC and the Atari seemed to be differend.
If it's also possible I'd like to know about the picture format's:
MAC, PCX, TIFF, etc.
Who can help me !!!

I've heard that every three months a message is send to NEWS, that explains
about the picture formats.
I hope there is someone who can help me.

Thanks !!!!

>only released 33MHz spec. chips.
>

The 68040 do have an internal clock doubler, although Motorola does'nt make
such a big fuzz about it. But using the Intel terminology in advertisment, the
68040/33Mhz would be a 68040/66Mhz (DXII) processor! I guess this is what the
maker of this 68040 ST enhancement project has done....

The blitter's adress registers are actually 32bit, but only 24 (vel actually
only 23 bit + UDS/LDS logic) is used, so it is definitivly 'limited' to 16MB.
This might only apply tho the old ST Blitter, but I can't see why it shouldn't
apply to the 16MHZ Blitter in the Falcon. Actually, if Atari decided to, it
should be easy to enhance the blitter to be abel to address the whole 32 bit
range (4GB)!!

In <mack.714929181@deci>, Dan Mack writes:
>
>1 . Do games like Falcon, Flight Simulator, Sim City, etc. run well
> on the TT? Too fast?

No, not many games do work (at least without doing some tricks)! But
does it matter. Who buys a TT for playing games? I'd rather buy a LYNX
for that purpose:-)

>2. Does Calamus and other word processing packages work?

Yes, almost all quality non-leasure software is now updated so it works fine
on the TT! Upgrades is sure to be available if you have older versions!

>3. Has Minix been ported over yet?

I'm not sure, most TT CLI freaks seem to like the MiNT/GNU combination
better than MINIX! There is ported a lot of UNIX tools for MiNT!
If you want to know more about this, you could contact Erling Henanger
(erlingh@idt.unit.no).

>4. Is there a Unix like OS for the TT? If so, has anyone gotton X11
> R4 or X11 R5 to compile on a TT?

Atari has ported SYSTEM V Rev.4 to the TT, but I'm not sure if it realy
is available yet? (This package should also contain X11)

>5. Are there any UNIXless X servers available for the TT?

Don't know

>6. If you own a TT, what are your impressions of the machine?

Fast & reliable.

>7. Which version of the Atari OS do the TTs run? 2.?? 3.??
>

The current latest version is 3.06. I've got it for some tim now, and can't
realy say to have discoverd any serious bugs. Even the RS232 RTS/CTS bug is
fixed.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Zoo says 'default' -- but it has a higher compression option too!
It takes longer, but does a better job. This tradeoff should be
taken into account.

Zoo is a lot more user-friendly than the other archivers, too. :)

Besides, to function with an atari getting stuff from the net, you
really need *all* archivers installed on your system, or at least
on your net-connected (UNIX) system so you can unpack and repack
the archives before downloading them.

My new mouse seems to have a will of its own:

Sometimes the pointer starts moving by itself in one direction: up,
down, left or right.

I remember reading somewhere that this is a "classic" problem,
so I guess other people have experienced it. Does anyone know more
about it such as a reasons, fixes, if it gets worse, if it is
totally random or limited to specific kinds of mouses?

(By the way, what is the preferred plural form of 'mouse'?)

2245. 2nd request - glib for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 15:00:38 UTC
From: bobhays@spss.com
Message-ID: <1992Sep2.150038.2391@spss.com>
Source record: 217907

I'm seeking the executables for glib for the Atari ST (glib is a general librarian for musical instrument sounds, or patches). If someone could email an ftp address or if someone would be willing to US mail me a diskette, that would be great!

Alternatively, if someone could post or email me the format for glib data files (for the Kawai K5 especially:-), I could then write a little program to read such files and dump them to my K5 at home.

Thanks and have fun! - Bob

2246. SUMMARY: Virus detection/elimination software

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 15:07:07 UTC
From: chu@acsu.buffalo.edu
Message-ID: <BtyHzw.LuG@acsu.buffalo.edu>
Source record: 217909

Hi,

Sorry that it took so long for the summary to come out.

I'd like to thank the following people for responding.

boblu@tekgen.bv.tek.com (Robert Luneski)
rutgers!tcpbbs.pcn.org!joeadato (Joseph Adato)
Volker_Soehnitz@ac.maus.de (Volker Soehnitz)
Jochen_Leufen@kr.maus.de (Jochen Leufen)

(I would like to point out that I haven't gotten any of these products yet, except for Sagrotan so all I'm doing is report what they told me.)

Two people mentioned The Ultimate Virus Killer, which is a commercial product. It kills both link and boot sector viruses and checks hard drives. It is also a disk repair package. It is being marketed by Oregon Research Associates. I don't remember offhand what net.policy is about giving addresses of businesses. I'm going to give their address here strictly for completeness sake and with the disclaimer that I have absolutely no relation with them. (I'm not even a customer of theirs!)

Oregon Research Associates
16200 S.W. Pacific Hwy., Suite 162
Tigard, OR 97224

Also:

B&G Electronics
15729 Madison Ave.
Cleveland, Ohio 44107.

sells it. Again, I have no connection with this store. Some of the people who responded suggested it.

There is a shareware virus killer called VIRENDETEKTOR. It is only available with a German manual and its menus are in German.

It recogizes all known ST link and bootsector viruses. Scans whole drives or partitions for link viruss very quickly (It claims 50x faster than Sagrotan.) There is the option of immunizing disks and estimates the "Virus Probability Factor" for unknown boot disks. It recognizes changes to the "rootsektor" (boot sector?) and can restore it.

(Claims to run on all ST type computers.)

VIRENDETEKTOR is Shareware, you can get the new version 3.1e by sending 35,- DM (30,- DM + 5 DM for shipping) or 23 US-Dollar to:

Volker Soehnitz
Beginenstr. 17
5100 Aachen
Germany

There is also a program called Sagrotan, but I didn't get too much information about it. I found it on atari.archive but since I don't know German, I didn't get too far with it.

Anybody out there have an opinion on this program? I can't speak on the missions yet, because it's got that maddening feature of insisting you accomplish Mission A before you can graduate to Mission B, and it's taken me two nights just to LAND the blasted thing in one piece.

I can say that the keyboard interface has a VERY slow response time -- sometimes you've got to mash a key for 4, 5, 6 seconds (!) before the action takes effect. Which is exciting when, for example, you're trying to drop the landing gear as the runway rushes up at you at 350 mph!

Is this program going to get better as *I* get better, or is it bad to begin with?

2248. Re: X-Control Problem and Request

This happens when you try to download and the port is set to 7bit/even parity.
For xyz to work (or any binary transfer) you have to be in 8bit/no parity.
Unix sz though usually sets the port to 8bit automatically, so try setting
the ST to 8bit before the XYZ.

This looked like too good a deal to not pass along. Nick can be reached at cabell_nick@tandem.com. Please don't reply to me since I don't have the machine.

--Jerry

From DUNHAM_JERRY@austin Wed Sep 2 09:45 CDT 1992
Return-Path: <DUNHAM_JERRY@austin.mpd.tandem.com>
Subject: Atari computer for sale - cut rate

------------ ORIGINAL ATTACHMENT --------
SENT 09-01-92 FROM CABELL_NICK @MAILMN

Second call. I'm turning the parts into a local dealer for $100. If you want to better that, call/reply before end of day Thursday 9/3.
Included:
-Atari 520 ST computer w/mouse
-Atari color monitor
-2 single-sided external drives
-Star SG-10 Dot matrix printer
-Software: Flight Simulator, children's games, Superbase, and more
System is works fine, but you must take the whole deal "as is".

2251. Problems with GNUmake 3.60

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 16:31:56 UTC
From: heinenb@messua.informatik.rwth-aachen.de
Message-ID: <heinenb.715451516@messua>
Source record: 217916

Hi all,

I got some problems with the GNUmake V3.60 that I got from a.a.
I wrote a makefile to compile and bind a lib I wrote before. I RCSd the
first few files and tried to make the lib another time. But there is a
problem. make calls co with "co xgetrc.c,v xgetrc.c". Using that command line,
co tries to extract xgetrc.c two times from xgetrc.c,v! But after the first
extraction, co states that there already is an extracted xgetrc.c and inter-
actively asks, whether that one should be used or whether the existing file
should be replaced by the new one. Is there a way to tell make to call co with
"co xgetrc.c,v" instead of "co xgetrc.c,v xgetrc.c"?
And another question: is there a way to tell make to auto-delete the files
it checked out just before compilation and to leave the source files that
already existed at the moment when make was startet?

yours,

Benedikt Heinen

2254. Spectre GCR, System 6 & AppleTalk

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 17:26:31 UTC
From: malay@sae.com
Message-ID: <1992Sep2.172631.10056@sae.com>
Source record: 217920

I tried installing "Freedom of Press Light" which claimed that the AppleTalk in the ROMS was not compatible with FPSpooler and then proceeded to install an AppleTalk file in the Systems Folder. Trying to reboot only hung the boot up procedure - after booting from the floppy and removing the AppleTalk file - rebootimg from hard disk worked but "Freedom of Press" did not because it needed the "newer" version of AppleTalk.

Spectre GCR , System 6.0.5 (I tried 6.0.8, too)

Any clues? Seems to be a Spectre Problem because FOP works fine on the MacPluses at work.

2256. Reible-card and ST/X-windows: how to buy in Canada?

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 18:09:29 UTC
From: seldin@alcor.concordia.ca
Message-ID: <4859@daily-planet.concordia.ca>
Source record: 217918

In May, I received information from Atari Canada that the Reible-card would allow me to connect my TT to an ethernet network, and that ST/X-windows would allow me to run X-windows from the GEM desktop. At the time, I was promised information on the price and how to order it within days.

I have still not received this additional information, and Atari Canada is not currently answering the telephone.

Can anybody tell me how much these products cost in Canada and how they can be ordered from here? (I want to pay for it from a research grant, so it will have to be ordered through the university purchasing department.)

Please reply by e-mail. Thank you in advance.

2259. CyberDrome Press Release

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 19:23:06 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Sep2.192306.24603@newshost.lanl.gov>
Source record: 217924

```
*****************************************************************************
* *
* Fair Dinkum Technologies Press Release 9/1/92 *
* *
*****************************************************************************

Fair Dinkum Technologies is proud to announce the immediate availability of:

**************************************
* CyberDrome -- The Hoverjet Simulator *
* *
* for Atari ST/STe/TT computers *
**************************************

CyberDrome is a new strategy arcade simulation developed by the wizards at
RHEA-FX, innovators of multi-player/multi-system computer games and simulations
and is marketed worldwide exclusively by Fair Dinkum Technologies.

The CyberDrome Universe:
-----------------------
CyberDrome is the name of a Virtual Universe which exists inside of a permanent
computer memory matrix designed to "grow" Artificial Life programs. Originally
intended to be a place for humans to interact peacefully with programs and data
via Virtual Reality simulators, it is now under attack by self-regenerating,
virus-infected programs controlled by a roque Artificial Intelligence system
called CJER (pronounced "Cee-Jer"). CJER has spawned its own army of attack
programs which have spread throughout the Matrix, destroying or capturing every
byte of data they come into contact with. Years of research and billions of
dollars worth of data are at risk of being destroyed by CJER's hungry forces.

To control CJER's army, the CyberForce Academy was instituted and the HoverJet
virtual-reality fighter-simulator was developed. Designed for speed as well as
heavy combat, the HoverJet allows Cybernauts from the Academy to interface
directly with the CyberDrome universe and actually "move" from point to point
along CyberDrome's expansive Memory Grid. Searching out the lairs of the virus-
infected programs hidden in the vast maze of tunnels known as Memory Mines,
Cybernauts strive to locate and delete these attack programs before they manage
to break out of the quarantine area known as the IPZ (Infected Program Zone).

But CJER is incredibly intelligent and is learning the Cybernauts' tactics while
his forces are growing steadily. Without the aid of hundreds more trained and
qualified Cybernauts, CJER's army is sure to break through the IPZ and capture
permanent control of all of CyberDrome.

The CyberDrome Simulation:
-------------------------
```

The CyberDrome Hoverjet Simulator is a real-time interactive training simulation designed to hone those skills required to operate a Hoverjet construct as well as fight intelligent attack programs. These skills are not found in everyone, however, and it is hoped that through personal computer based simulators like this one, future pilots can train at home, and perhaps one day be selected to join the ranks of the CyberForce.

Features:
----

* CyberDrome is unique in that it combines the realism of a real-time, 3-D flight simulator in a Virtual Reality environment with arcade action along with the problem solving requirements of a dungeon type strategy game.

* Not only does CyberDrome offer the usual single player mode, it also provides a unique 2-player/2-computer mode (using a serial cable or 2 modems) whereby two players operate as a team. During this mode, players actually view the movements and actions of their partner through the viewports of the highly realistic cockpit of their own Hoverjet. Communication between players i also enhanced via both Direct and Quick-Comm Message systems.

* Unlike many other simulations, all elements of CyberDrome's single-player mode are also active in the 2-player/2-computer version.

* CyberDrome is being developed for multiple computer platforms, all of which will be link compatible with the Atari ST 2-player/2-computer version (i.e., a user with an Atari ST could play a CyberDrome game with an IBM PC user).

* Also included is a special 2-player competition mode designed to increase your skills as a Hoverjet pilot.

* Six increasingly difficult mission levels are included plus a special training mission level for beginning pilots.

* Official CyberForce ranks are awarded to players for successful completion of each mission level.

* Additional mission disks and Memory Mine maps will soon be available separately for extended CyberDrome play.

* Only a select few will ever successfully complete CyberDrome's difficult Mission Level 6. For the first ten registered users that do, however, their efforts will be awarded with a limited edition "CyberDrome Racing Team Champion" T-shirt! Specific contest details available upon request.

Perhaps the Cybernaut motto best summarizes the world of CyberDrome:

When your nightmares become your reality, try telling yourself...

"IT'S ONLY A GAME!"

==========

"CyberDrome - The Hoverjet Simulator" requires an Atari ST/STe/TT computer with a minimum of 1Mb RAM, color monitor and double-sided disk drive.

From: noykman%peruvian.utah.edu@cs.utah.edu
Message-ID: <1992Sep2.140630.1653@hellgate.utah.edu>
Source record: 217926

Hello fellow Atari users! I am interested in getting a TT030. But before
I do, I would like to have some questions answered.

How much more would an upgrade to 4meg cost, on average, over the basic system?
"" 8meg ""

How much more would an upgrade to 120meg cost over a basic system?

What is a good price for a TT030 basic system?

How much software is avaliable or in delevopment for the TT?

Would it be possible to use the 68040 60mhz package of recent fame with
it?

When will TOS 3.06 come out standard on the TT (I heard this fall.) Will prices
be likely to rise after this upgrade?

Any answer to the questions will very much appeciated! I have no intention of
leaving Atari's camp, and am looking forward to a INFORMED purchase?

Once Again, thanks for all the information,

Nathan Dykman

(noykman@peruvian.utah.edu)

You may mail me or post here. Thanks!

2262. Re: Dungeon Master Version Numbers

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 20:06:29 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Sep2.200629.20759@actrix.gen.nz>
Source record: 217929

Version 1.0 of Dungeon Master was the 1st release, and had bugs at
the end of the game. Trying to shut Chaos in a door made the game
crash. And it had several other bugs....

Version 1.2 fixed the chaos bugs. And changed these:

1) At the begining of the game there are more small stones that you can pick
up and use to throw at the monsters until better equipped.
2) When you get down to Level 11 (the knight level) in one area you will see
a sign that says IF you run you will be chased down and killed
(something like that) In v1.0 you had 2 doors and when you
entered into the doors it opened a secret wall and there where 2
more spiders waiting for you. In v1.2 they put a door there and it makes
it much easier. Although they did make it a little tougher in another area
where instead of having to kill one set of 2 knights you have to kill 2
sets of them without the assistance of doors.
3) they have taken the RING OF TIME from the level 7 (ghosts and arena
area)
4) In the RA LEVEL they have removed the Lock Picks. But that was no
loss they did nothing anyway.

Generally - those are the only major changes, all the rest is fixing
bugs - so the game is virtually uncrashable! (Even v1.0 is almost
uncrashable, except where Lord Chaos is concerned)

Yes, I have be posting a lot. Here is a couple more questions.

Having finished DM and Chaos, I am looking for a new challenge. Does the DM cons. set come with new dungeons? Is there a DM III on the way?

Where can I get a copy of the DM cons. set?

Thanks a lot, yet once again.

> the archives before downloading them.

ZOO is only user-friendly if you are being pointless and running UNIX on an ST. RUnning it from standard GEM, you can't re-direct it's output, which is a real nuisance! ZOO, ARC, and LHarc can all be told where to put their extracted files/archived files once they have extracted/archived them!

I have shown the 'High compression' method of ZOO. It takes a LONG time - and gets about the same compression as Lh5 (LHarc), it's slow speed is it's only MAJOR draw-back, optimising the code a bit, and speeding up the routines would make it quite usable! (Also adding a re-direction for the GEM users, the numbers of which seem to be very small in an Atari message area - seems quite illogical!)

ZOO's compression isn't bad as seen here:

Compression (% of original size)

ZIP (Deflate) 37
LHarc 38
ZOO (Slow mode) 38 (10 bytes bigger than LHarc)
ZIP (Default) 41
ZOO (Default) 56
ARC 58

10-bytes difference is not much - especially as the file-size is always rounded up to the nearest 1k, as more than one program can't occupy the same sector on the disk - so GEM reserves it for that program/file, and so a 689 byte file, is actually 1k big (1024 bytes).

Unfortunately - this good compression, loses out on the speed: (Note 'Slow Mode' is the 'High Compression' mode of ZOO)

Time taken:

ZIP (Default) 36 secs
ZOO (Default) 45 secs
ARC 50 secs
ZIP (Deflate) 61 secs
LHarc 62 secs
ZOO (Slow mode) 90 secs

it took 28 seconds longer than LHarc to compress to virtually the same filesize. the file it was compressing was only 150k. Zip's Deflate mode was only 1-second quicker than LHarc, but it got almost 2% better compression! (No biggy, but it's an improvement!)

Try 'VKiller'. It's English, it's simple, and it recognises all
viruses around. (No new ones have been reported that I know of since!)

It has a couple of useful features like being able to disable the
Boot-sector, to let you boot with the disk to see if the Boot-Sector
is required or not. If it isn't, you can kill it. If it is, you
simply restore it!

Only recognises Boot-sector viruses - but as link viruses are VERY
rare, that's not too big a problem! There is an english version of
Sagrotan out there somewhere - it's an older version than the German
one you probably have, but it works just as well!

At least to me, compression is the important thing. It may take a
-little- longer to compress or decompress a file, but when you are
downloading it long distance or off one of the services (like GEnie) then
the compression saves you some money (particularly over the long run).

Actually, I got mail back from the author of Connect and he recommended that I use the strip-bit-8 option. (this should work, but I haven't had a chance to check it out).

[problems using XYZ2.01 deleted]
>Is this the first term program you have tried? Have you tried Freeze Dried?

This is not the first term prog that I have tried - I normally use Uniterm (which works nice in STHIGH but I wanted to move to something that supports TTmodes, new graphics cards, etc.) and a couple of other term progs (I just deleted as they were worse than Uniterm), but I have not had a try at Freeze Dried. Does it support VT220? BTW, XYZ2.01 works fine with Uniterm, but not with Connect and the author is not familiar with XYZ. Has anyone successfully gotten Connect to work with XYZ? If so, what version/setup do you have? If no one uses XYZ, what Zmodem external program do you use? He suggested Zmodem by (I forget authors name just now).

>Apparently there is an ENGLISH version of Connect in circulation. As far as
>the program anyway (or is this what you have now?). I gave up on trying to get
>it run. I find Freeze Dried great (although I'm only running 2400).

Yes, I have the English version of the Connect - actually very easy to Englishify it by renaming conneng.rsc to connect.rsc. However, the manual is not so easily changed. :(. Wolfgang (the author) said that someone in Canada is supposedly working on an English manual, but hasn't gotten word back from them yet....

The only real peeve I have now is the slow updating, but Wolfgang says that NVDI (and I would imagine Warp9) should fix that, as well as giving access to more screen fonts. We'll see. :)

Thanks for help from you guys! (and gals :)

2277. How to Xfer Program ST -> Mac ??

Newsgroup: comp.sys.atari.st
Date: 1992-09-02 23:11:48 UTC
From: scotty@verdix.com
Message-ID: <1992Sep2.231148.13689@verdix.com>
Source record: 217948

Hi.

I've read a few FAQs but haven't found an answer to this problem yet.

I downloaded several .SIT (stuffed) files for the Macintosh using my ST,
and put them on a floppy formatted for the IBM PC. I used Apple File
Exchange on the Macintosh to transfer them over to the Mac.

When I then execute Unstuffit and select to unpack these archives,
Unstuffit does not recognize these files. They transfer over to the Mac
with a file type of "document", which is apparently wrong.

Does someone know how to make Unstuffit recognize these files? Or, could
a different method be used to translate these files to the Mac?

Unfortunately, the Mac these files are going into doesn't have its own modem,
so they have to be transferred indirectly via disk.

Thanks for any help.

>maker of this 68040 ST enhancement project has done....

Actually, this is kind of backwards. Every Intel chip <486 and every
Motorolla chip <'040 ('030?) use clock dividers. The '486 and the '040
actually use the external clock for their internal logic. Intel DX2 chips
use an external clock that is twice the speed at which it communicates with
its external lines (Address, data, BACK, etc.), and thus the rest of the
system runs at 1/2 of the processors speed. I believe the '386 uses a
2:1 divider.

Actually, Windows 3.1 does work with a 286, but only in Standard mode (they got rid of real mode btw). I have an AT right here that I was trying to install Norton Desktop for Windows on. BTW, NDW does NOT work on Win3.1 on a 286 :/. It crashes and leaves you on a desktop with NO tasks running - you can't quit from Windows because there is no program manager to quit from - but the task lister still works. :)

When you press <ESC> to update a directory window, the desktop forces the operating system to think that the disk has changed (just as though you had removed it and put in a new disk). This even happens for disks that really have not changed (like hard disks).

Since MiNT has been told by the desktop that there is a new disk in the drive, it closes all files that were open on the 'old' disk, and prints a warning message to tell you this if there were any.

>uncrashable, except where Lord Chaos is concerned)

Well, my version (can't remember which it is, since I am without a color display of any kind right now) starts acting wierd after an hour or so of use. The floppy disk is accessed for no apparent reason, again and again, with increasing frequency, and eventually results in the death of all my characters. I get the dreaded scream-and-crossbones for each character, aigghhh...aiggghhh...aigghhh...aigghhh. When I see the floppy-access light come on unexpectedly, I know I have to save soon and re-boot.

And, no, I am not running a pirated version. (I even have the FTL [swoosh!] sticker on my floppy-disk carrier.)

2287. Re: looking for an assembler

Newsgroup: comp.sys.atari.st
Date: 1992-09-03 04:27:59 UTC
From: Stefan Monnier <sm86+@andrew.cmu.edu>
Message-ID: <UedNFDa00awN8RnnV_@andrew.cmu.edu>
Source record: 217953

Excerpts from netnews.comp.sys.atari.st: 2-Sep-92 looking for an assembler ppospis@mtroyal.ab.ca (453)

> I am looking for a PD assembler/linker/debugger. It would be
> preferable to get an integrated entity, however, if necessary
> I am willing to consider independent programs. Any suggestions?

> An ex-Atari ST person has indicated that there was a proprietary
> assembler product out in the 80s by Metacomco or Techstar. Has
> anyone else used this and if so do you have the current phone/fax
> number?

> Please e-mail direct. Thanks.

> Paul
> ppospis@mtroyal.ab.ca

Well, I don't know for the linker, but for the rest, TurboAss is what you're looking for.

Else, you may try the gas with GDB all from GNU (with gcc and the likes): it is much more powerful, but uses much more space disk and memory. (and maybe less user-friendly)

Finally, just check in a.a.u.e for some others !

Stefan Monnier

Warner is not going to do any BILLION DOLLAR ad blitzes for Atari Corp (note: corp) unless Atari pays for them. That's because Atari corp isn't the company that Warner is aligned with, it's Atari Games, the people that make the arcade machines.

Warner used to own Atari corp many moons ago, and did their damndist to kill the company outright by making it a red ink tax right off after it started to have a sour year. Atari corp was "saved" by Jack Tramiel, of the "Commodore 64 will kill Atari" fame.

I just wish that there was an ARJ compressor for the ST, the UNARJ leaves
the others for dead, it's compression is better than everything else,
and it's speed it only very slightly slower than the fastest one!
Any of you people in .tech reading this feel like writing one? :-)

some results from a test I did a while ago....

The test was on : 34 files, 231065 bytes uncompressed

Method	Size compressed	Time to decompress
LZH	109900 bytes	38.5 sec
LZH v5	88268	43.9
ARC	129045	39.5
ZIP	110628	25.2
ZOO	89462	40.7
ARJ	87812	26.4

Good choice.

>How much more would an upgrade to 4meg cost, on average, over the basic system?
> "" 8meg ""

To 4meg ST RAM: about $300. To 4megST/4megTT: the $300 for ST RAM, plus about $500-$600

>How much more would an upgrade to 120meg cost over a basic system?

The price of a 120meg drive. You can get the TT without internal drive, and either you or your dealer can install the 120meg drive.

>What is a good price for a TT030 basic system?

Oh, about $1600, but read on...

>How much software is avaliable or in delevopment for the TT?

Tons.

>Would it be possible to use the 68040 60mhz package of recent fame with
>it?

No.

>When will TOS 3.06 come out standard on the TT (I heard this fall.) Will prices
>be likely to rise after this upgrade?

TOS 3.06 and 1.44meg drives come standard. If your dealer told you this fall, search for another dealer. I've heard that TT prices have come down a bit too.

Sure there is. Get djpeg off of atari.archive. It is a freeware
(I think) program that will convert .jpg to .gif.

-Mike

BTW: Gemview 1.1l and greater will view .jpg files.

2292. Problems with Connect and XYZ....

Newsgroup: comp.sys.atari.st
Date: 1992-09-03 06:19:02 UTC
From: baffoni@aludra.usc.edu
Message-ID: <labbimINNd0k@aludra.usc.edu>
Source record: 217958

Hi all!

I just wanted to thank all those people who responded to my plea for help with Connect and also with XYZ2.01.

My problems with 8/none were solved by going to the "kompatibility" menu and selecting "strip 8th bit". Now emacs and normal terminal stuff is very happy.

By going to 8/none, it also solved my problem with XYZ - as a poster noted earlier, XYZ only works with 8/none, so it now works within Connect.

Now that XYZ works, it autosenses a zmodem download and that works fine.

Now all I have to do is get a screen accelerator and GDOS working, and my terminal stuff should be awsome (not to mention installing MiNt, but I think that may have to wait awhile...:( )

I must admit though - it feels funny needing a screen accelerator for my TT to get display speed to catch up with 14.4k (roughly) bps screen updates.

Again, BIG thanks to all who helped!

-Mike

> Jens.
> --

Thanks for the response. I already thought "Another message that went into
the big BLACK USENET HOLE"

I do not know anything about the concetp of dumping EMACS 18.58, and I will
try what you told me. But I do NOT understand why the simple method with the
environment variables does not work. It look like it did in your case either.
As I only have the binaries I don't know if and how I must specify the
PURESIZE parameter. I hope first method with copying the *.elc files into
the e-bin directory works.

cheers andreas pauletti

> Mark Kovarski

Being active in the digital music/mixing field, I would STRONGLY advise
that ALL PROGRAMMERS should NOT implement ANY type of audio compression
for professional applications. (ala MAC Alchemy, Sound Tools, DECK, etc).

Compression ratios would make the software worthless. Perhaps for little
toy editors and such, (strict multimedia, etc.)

If you're using mint: install ps0.zoo and gnutar. Then you can use
/dev/ps0 exactly the same way as /dev/fd0 on any unix system, and it
is compatible.

The Dungeon Master editor is commercial software, not PD
or Shareware. There's a demo of it on atari.archive under

atari/games/dmeditor.arc

which I presume will contain information on where the
original is available. The program isn't particularly
versatile, though- you can move walls and that's about it.
There's a DM dungeon which was created with it in the new
directory of a.a- atari/new/dmdung2.arc but don't expect
too much- it's pretty similar to the original.

It matters plenty! If games don't work on the TT because they are poorly
written and don't take account of the 68030 then the same games will not
work on the Falcon. I can easily imagine people buying Falcons to play
games.

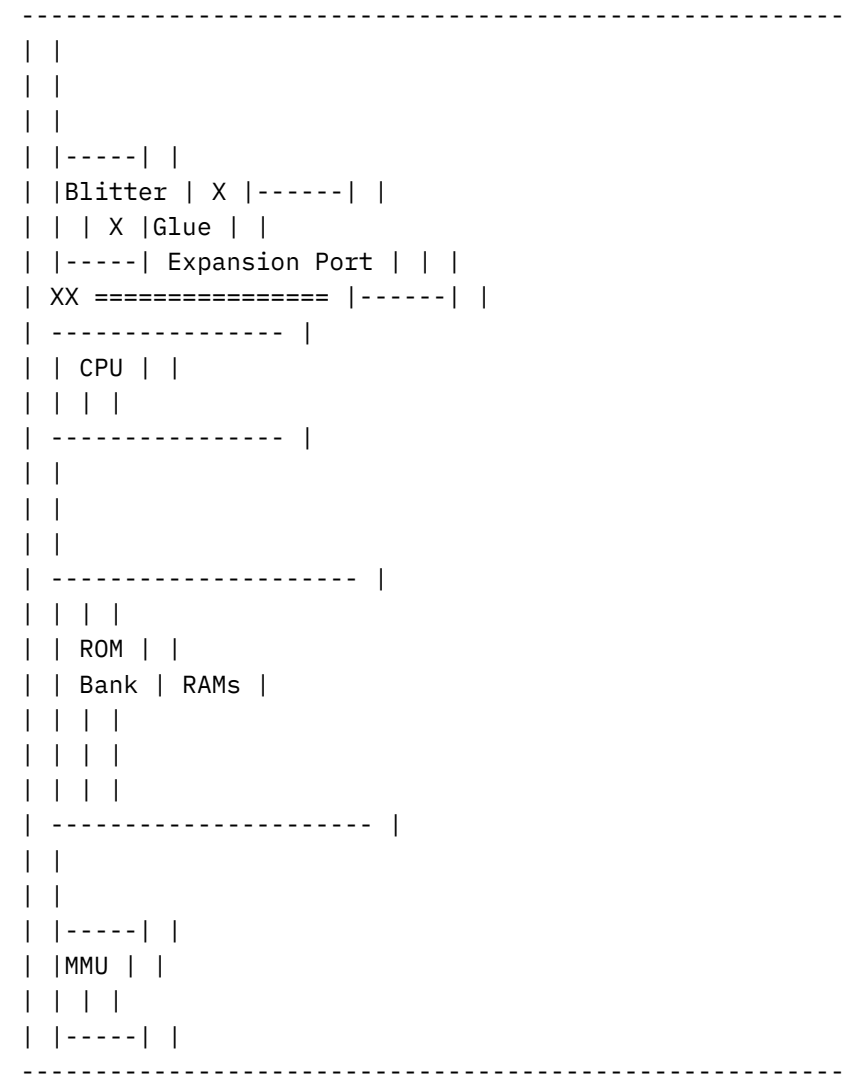
From: tries@obelix.kph.uni-mainz.de
Message-ID: <61N6VHU@minnie.zdv.uni-mainz.de>
Source record: 217969

Hi,
I have an old MEGA ST2 running under TOS 1.02 (into 2 Chips in the ROM-Bank).
I've the The TOS 1.04 (Rainbow-TOS) in 6 256k-EPROMs too. I've soldered 4 new sockets into the ROM bank. But I'm hunting for the solder-bridges to tell Glue and MMU the new ROM configuration (6 IC's instead of 2).
I found 2 of them, both arround the blitter chip.

My hardware looks like this:



I found the two solder Bridges at the locations marked with 'XX'.

Waiting for help

Be careful on the numbering. On a 286, Windows 3.0 AND BELOW will work (not just 2.x). But I *think* Windows 3.1 is stuck to 386 and above. Best place to ask this question would be in one of the "windows" newsgroups. Anyways, Windows 3.0 should work fine on a AT Speed C16...

I had similar problems when I tried to dump it. Sometimes I'd get it to find loadup.el, but it would then fail to find an (apparently) random file later on. In the end I got round this by using a different shell (the somewhat brain-dead Batcher (no offence Hisoft, the rest of the packages is superb) that comes with Lattice C). Even dumping manually didn't seem to help. It looks as though (at a guess) the dumping code in Emacs itself is broken, possibly its trampling on the environment at some point, or possibly just overwriting its local copy of where the lisp files are stored.

Sounds good. I just have one question: Is this a "true" zip20 or
a hack of version 1.93a or ...
Sorry for being my suspicion, but following comp.compression I have heard
about several "fake" zip's version 2.0 (or slightly higher) for MS-DOS.

Message-ID: <1992Sep3.143732.26091@wega.rz.uni-ulm.de>
Source record: 217973

Hi there!

This may be too stupid for some of you, but if so just skip the message. I just wanted to get some help on a problem that I encounter frequently with my ATARI.

I use a 1040STFM with the Blitter-TOS (1.02?). The thing that troubles me is that the system comes up frequently with a message like 'Not enough memory for this application' although the whole memory should be free. Any hints?

Another thing that is annoying is that I can't get programs installed as applications so that I can double-click the text-file e.g. instead of the editor. The system always says that 'the application can't find the desired object' after looking on drive A: when I didn't ask for anithing on drive A:. It works well from within GEMINI, but not from the GEM desktop. What's wrong?

Thanks for bearing with a not too experienced user.

2310. PERFPICH.TOS v1.1 posted to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-09-03 15:25:28 UTC
From: selick@csa.bu.edu
Message-ID: <95283@bu.edu>
Source record: 217974

I just uploaded my PERFPICH.TOS v1.1 to terminator.cc.umich.edu in the /atari/new directory. It is a few minor bug fixes to the old 1.0 program, recompiled with GFA 3.5E. It's a self-extracting archive made with the stzip20.tos program that was just uploaded.
-Steve <selick@csa.bu.edu>

2311. Thank you Darek for your support of the ST

Newsgroup: comp.sys.atari.st
Date: 1992-09-03 16:15:49 UTC
From: boblu@tekgen.bv.tek.com

Source record: 217977

What follows is a message posted by Darek Mihocka to comp.sys.mac.misc, comp.sys.ibm.pc, and comp.sys.amiga.

->Article: 33036 of comp.sys.mac.misc
->Path: tekgen!zephyr.ens.tek.com!uunet!microsoft!hexnut!darekm
->From: darekm@microsoft.com (Darek Mihocka)
->Newsgroups: comp.sys.mac.misc,comp.sys.ibm.pc.misc,comp.sys.amiga
->Subject: Atari Falcons $799... WHO CARES! Just emulate it.
->Message-ID: <1992Sep02.184109.8805@microsoft.com>
->Date: 2 Sep 92 18:41:09 GMT
->Organization: BraSoft
->Lines: 33
->Xref: tekgen comp.sys.mac.misc:33036 comp.sys.ibm.pc.misc:28758

->The $799 Falcon, who cares! Atari has a long history of announcing vaporware
->and then either never releasing the product, releasing it in extremely
->small quantities (to be able to claim that they shipped it), or they ship
->it either severly crippled or at a much higher price.

->Their most recent blunders include the Atari TT (the crippled 68030 machine
->that barely outperforms a 16 Mhz 68000), the ST Book (the notebook that never
->was), and the "under $1000 68030 machine" Falcon. Notice that the $799 price
->is for a 1 meg machine with no hard disk. Gee, that's a throwback to the
->1986 days of the 1040ST! If you want a useful computer with 4 meg, a hard disk
->and a nice monitor, well, Atari says you'll have to fork over much MORE than
->the $1000. You can't even use Atari's laser printer with 1 meg machines.

->So, once again Atari has shot themselves in the foot by releasing an overpriced
->piece of technology that's already obsolete because they took so long to
->release it.

->Give me a few months to
->add 68030 emulation and you'll have yourself a Falcon emulator. Don't waste
->your money on the real thing and hell, why even lose sleep over it. Chances are
->slim that you'll see Falcons flooding dealer shelves any time soon.

->- Darek

Atari may have sold 2 mill. Batman Returns carts, but they did not sell to Joe Schmo, they sold them to game distributors. Every store that carrys Lynx games that I know of (about 9 or 10) has lots of copys of B.R. in stock. So, it shows that the distributers were confident in it, but it doesn't say anything about how well the game has sold. I would really like to know how well it is selling to the consumer.

No, not a "drawing" program, a "line Drawing" program, one that makes lots of colorful lines go flying around the screen.

>>(in high-rez color on a graphics board of some type),
>
>Ands the wieght of the falcon didn't even crush the graphics board...
>a very safe paperwieght!

Huh? Oh, wait, sorry, another rabid Amiga user, as can be seen from the line below, for a moment I was taking you seriously... Next time you decide to write something as inane as this, at least try to read the original post, it was *not* on a falcon, it was on a Mega-4, which is surely heavy enough to crush the graphics board, except that it fits inside the machine, just like most graphics boards.

>>a program was loading a GIF
>>in the background,
>
>...on the amiga next door...

{ Lots of absolutely amazingly childish stuff deleted }

>Still, knowing Atari computers, Amiga users probably WILL be very
>happy if this thing gets produced. We all say C= doesn't advertise
>enough... let's let Atari do it for us...AGAIN!

Why is it that there seem to be a *few* Amiga owners out there who seem like they somehow got access to the Net at the age of 12 or so? I suppose there are some Atari users out there like this too?

Hmmm... Well, as far as I can tell, MultiTos looks like it multi-tasks as well as the Amiga (which, IMHO, is better than the Mac or PC by a long shot). The only thing it won't do is Floppy Access while performing other functions, however, if the Falcon has this new chip that controls drive access etc, then maybe it will even do this? Anyone know?

Oh, I don't get the statement above about C= letting Atari advertise *for* them? It makes no sense as far as I can tell, am I missing something, or is this poster just missing his sense of humor?

Source record: 217981

Bob,

Unfortunatly for people like yourself and myself, only Atari can provide a healthy growing ST community. Also unfortunatly, Darek has a valid point: Atari is losing the opportunity it had by not having quantities of Falcon available this year. His other point about pricing is again a valid one, and one I've been worried about myself. If Atari is going tomake new computer owners come up with $1000-$1500 for a machine withh enough memory and a hard drive, why would they pick Atari over PC? The Falcon has to sell to NEW owners, not just ST people upgrading.

my 2cents.

>written and don't take account of the 68030 then the same games will not
>work on the Falcon. I can easily imagine people buying Falcons to play
>games.
>

If You'r concerned about Falcon's compatibility you'r doing some wrong
assumptions!
The TT and the Falcon 030 may have the same processor, but that's not the
same as beeing identical machines in respect to compatibility with the ST.

First, all hardware in the Falcon resides within the same 24Bit addressing
range as th ST. In the TT, there are a full 32Bit addressing range wich
causes a lot of trouble for some games.

Second, the Falcon is designed to be as compatible with the ST as possible.
The TT was designed to be as powerfull as possible, and at the same time
a TOS machine wich should run any well written GEM application. Nothing
more was ever promised.

Third, the falcon is a consumer product, the TT is not! This beeing a fact
makes it obvious why Falcon has to be more 'old-ST-games' compatible than
the TT was.

And last, don't you forget that many games doesn't even tolerate the 16Mhz
and cache of the MSTE (or speedup-boards for old ST(E)'s). Some games are
even quite intolerant to different TOS versions to! So, I'd bee more concerned
about the compatibility of the games, rather than about the compatibility of
the machines!

Not true. Individual tones cannot be detected above 20K, but people
can detect sounds above 20K as 'nuances' in music and can tell when
these frequencies are absent. So sampling needs to be 100Khz or higher.
I forget which British audio lab did the report on that.

> cheaper. The only thing that the LCII has is a superior O/S but TOS is
> getting better.

> Darren King, GBC :: emai : gbcusg@gpu.utcs.utoronto.ca

I fully agree. I just precise: LCII and Classic II have the same processor
running at the same speed and having the same PROBLEM:

Their data path is only 16bits wide !! (although the 68030
is able to use 32bits of course)

It makes them about half the speed of a IIcx (or of a Falcon)
At least for processor performance !

Stefan Monnier

needs to be 100Khz or higher.

Well, that might be correct, but I'm quite happy with the sound of my CD player, which plays samples at a measly 44.1Khz... And only 16 bit ones, too.

BR was on Babbage's Top Ten list for August. I think that was the first time a Lynx game had made the top ten, so it would appear sales have been brisk.

...Kev

P.S. Robotron and Robo Squash are now at Babbage's for $12.99. (Price may be a bit higher at some of the babb's with less competition).

2333. elvis 1.6 `beta' for TOS/MiNT, patched one bug...

Newsgroup: comp.sys.atari.st
Date: 1992-09-03 22:44:54 UTC
From: nox@jelal.north.de
Message-ID: <2376.09.92@jelal.north.de>
Source record: 217858
Cross-posted to: comp.sys.atari.st,de.comp.sys.st

i received a bug report and patch for elvis, and because that one can be quite fatal especially on poor ataris without memory protection i decided to make a new archive. (well it never happened to me but... :-)

this patched elvis 1.6 for the atari is now on ftp.uni-paderborn.de [131.234.2.32] in either pub/atari/incoming/elv16beta2.zoo or pub/atari/MiNT/mgnustuff and on atari.archive.umich.edu [141.211.164.8] (is that ip address still right?) in atari/new/elv16beta2.zoo. (tnx to warwick for uploading it there...the connection from germany is something around the speed of a teletype. :-( ) (btw, wowbagger...uni-bremen.de had `No space on device' yesterday but local uni-bremen users can get it on alf in ~d09c/pub/atari.)

or if you already have the first version you can also apply the patch and `make': (there even are some warnings so you can try elvis' errlist feature: :-) just do the :make in elvis and when its finished hit *...)

```
*** vi.c~ Wed May 13 18:30:00 1992
--- vi.c Wed Sep 2 00:48:56 1992
***************
*** 669,674 ****
--- 669,687 ----
break;
}

+ /* CHANGE: adjust tcurs again. It may be two lines
+ * beyond EOF here, since it could have been beyond EOF
+ * before the adjustment above already. I might be
+ * better to avoid the adjustment above if tcurs was
+ * already at EOF, but I am not sure, and adjutsing
+ * again seems more general. --hp
+ *
+ * ...but not adjmove because that also `corrects'
+ * the column. -nox
+ */
+ if (markline(tcurs) > nlines)
+ tcurs = MARK_EOF;
+
/* run the function */
tcurs = (*vikeys[prevkey].func)(range, tcurs);
if (mode == MODE_VI)
```

...and the rest of this message is a repeat from my original announcement:

Newsgroups: comp.sys.atari.st
Subject: elvis 1.6 `beta' for TOS/MiNT

[...]

note this is *not* an official release, so don't blame steve if
something goes wrong. but i am intrested in your comments of course...
(i use it now for about 3 months and apart from one rare redraw problem
that was also in earlier versions i have fixed only 1 bug since then.
so it is quite stable...)

here comes the readme...

------------snip-----
From: Juergen Lock <nox@jelal.north.de>
Subject: elvis 1.6 for MiNT/TOS -- readme

[^^^^ so you can easily reply]

due to popular demand :-) and because its still some time until this will
appear in an official release: here is the current state of elvis on
MiNT/TOS. features:

0. this is an *inofficial* version. even the original 1.6 src it is
based on you won't see posted somewhere... next will probably be elvis
1.7 appearing in comp.sources.reviewed. (but still without this MiNT
stuff built in.) so if you find problems and bugs don't bother steve
with it (yet), they're probably mine anyway. :-)

1. runs fine on both MiNT and TOS, but needs MiNT libraries to compile
(and also probably gcc). i have left the #if TOS stuff in (my patches
use #if MINT) but you should use that only as a last resort. (the MiNT
version runs better even under TOS.)

2. behaves itself under MiNT. that includes stuff like not busy-wait on
the terminal, use pipes instead of tempfiles etc... (looks at the __mint
variable)

3. and of course shell escapes etc work like you would expect of a vi.
:r !ls -l ... !Gtr -d '\015' (but see 6. :-)

4. uses -ltermcap. (that one was easy...)

5. uses the `special key' mapping of the messdos version (see docs)
and also maps the shifted cursor/insrt/home keys wich would otherwise
give digits. some of the keys can also be defined in the termcap entry,
if that is found a default mapping for the others is used.

6. new options: crlf (read/write \r\n, can be changed anytime) and
stbios (screen io thru BIOS, default on TOS, off with MiNT).

7...and varios fixes and other thigs i have forgot.

here is the termcap entry i use on the console...

```

This I have to check out a bit before I can accept:-) In some way it makes
sence, but in other it doesn't!

I remember to have read that you could replace a 486DX with a 486DX2 and gain
som real increase in performance, without changing the clock frequency in the
machin!?!?

>/atari/new directory. It is a few minor bug fixes to the old 1.0
>program, recompiled with GFA 3.5E. It's a self-extracting archive made
>with the stzip20.tos program that was just uploaded.

PLEASE. If you upload anything to atari.archive, post a DESCRIPTION of
it here, not just "I uploaded X". What the hell is "PERFPICH.TOS"?

Especially when is is a (yuck) self-extracting archive - since people have
to transfer it all the way home before being able to read any README or .doc
files in the archive (whereas others can be downloaded to the host, and
examined there).

Thanks all,
Warwick

It's true if you run your ST under 8mhz... but if you soup your
machine up (I have a MSTE) to 16mhz, have a blitter, and one or
more (PD or commercial) software that enhances your text (etc...),
you won't have that problem... (could be other reasons too!).

It's not just the ST that has this problem... I've worked with a
friend's 386SX running at 16mhz and the mouse response is sometimes
slow.

I know that the problem may also lie in the mouse buttons or maybe
the connection...

>
>(2) Printer drivers have to be assigned at INSTALL time or by editing a
> file.
>
> This is a MAJOR failing. Call the system user friendly? Even the
>first version of MS Windows had the capability to select the type of printer
>driver from a menu at any time.

Why is this a major flaw? Printer drivers are software.... the
people who wrote those don't have every printer in mind... Just
because it's Epson (or other) compatible, doesn't mean that it's
100% workable on your XYZ (non-EPSON) type printer...

I think that you are referring to being able to change the
printer driver through Windows... Well, as far as I know (I hope),
GEM permits (through the Control Panel) the user to choose options
fitting his printer, BUT, it is not the printer driver (type) you
are reffering to...

Software-wise, you choose the printer driver through the program...
I may be wrong on this...

>Please note that I'm not saying MS windows or MacOS is the way to go... or
>my machine in better than your machine. I'm just trying to say what I
>believe needs to be done to make the Atari version of GEM a modern and

Agreed. AND I hope that ATARI does something quick! I've
stayed with them for awhile (1: 1040ST 2: MegaSTE4 3:???)

They better support their machines they are spitting out.
It seems that the MegaSTe's (and soon TT's) are fading away...

(noticed how the MegaSTE's dropped in price (pissed me off)...
...because I bought it when it first came out)

>we're now up to Mac and PC standard. The sound system was very good
>though, the sound coming from the>Falcon was as good as a CD.
I don't agree with Mr. Martin in his first statement. 1) The falcon is not a a high end business system, so you can't expect it to be pure state of the art. It lacks serios internal expansion such as VME, not to diss what it has for internal expansion.2) For features it rivals NOTE!! The latest Apple Lc and surpasses it in features by a longshot. It's rivals are the Mac Classic II and 386 Sx's.It beats the Classic in price,features and performance and beats the
SX's in sound,I/O,price, and frames/sec but not in video resolution.

>I guess everyone knows that the GEM interface has gone '3-D', i.e 3D borders
>on windows and 3D buttons just like Windows.
>I did notice some other companies showing what I think was MultiTOS
Just a bunch of other things that are/were long overdue. I must also add my own comments. The ST line are great bunch of systems but are destined to failure if Atari does not advertise over some major channel (e.g. MTV) or do some major promo. America does not know about the great American ST.
>And Atari didn't show any STEs.
So what's new, would you show a system that HAS THE POTENTIAL OF BECOMING A DOG
NOTE a) the Falcon 040 is going to be a souped up TT + 040+ Falcon features.
b) Atari is yet to scr*w up it's users again so don't be hasty to crave for a Falcon. And don't expect superior Pc emulation or 386+387 combination, remember the ABAQ, cp/m for 8-bit, TT unix (not yet released), and the STT no dealer in the U.S. knows what it is and what means to a local harry.
c) Pray for a multiprocessing feature on the Falcon040 e.g. (68000+486 with VMe
+ EISA), also realise the Falcon has no external floppy port (as noted in the sept issue of Atari advantage). Commodore is going to see hell (A600 and A500 are well behind the times sorry to say
from Rensselaer Poly NY. Please also send info on all ST ftp addresses and somexplanation on WHAT HAPPENED TO THE PARSEC GRAPHIC INTERFACE.

>

Umm, are you sure that this isn't the ouput from the stereo audio out? It's
a miniature stereo headphone plug (1/8" probably) and this would give you
the two main channels of "what-everable" sound.

>Will there be a mod or future Falcon that would have 4 DSP ports on the back
>for 8 discreet channels?

The DSP port can output whatever it wants to, the key here is that it's a
digital port (most computer ports are :) and the output is completely
software controllable. So, if you wanted to send all 8 channels through
the DSP output to an external box which could do a D/A conversion and/or
mixing, you could have 8-channel (or 4-channel stereo) sound output. However,
this would require the extra hardware, i.e. some sort of interface to plug
into the DSP port (well, that IS what it's for right, to plug extra things
onto). Anyone else wondering how we're going to plug 10 million interfaces
onto the DSP port? Perhaps a DSP port switchbox could be a lucrative device
to make. :-)

Hmmm. Most of the retailers I know usually get 5-6 copies of a new Lynx game at a time, and I don't think BATMAN RETURNS was an exception. In any event, my friends in the retailer business keep taking about brisk sales of BATMAN RETURNS. Not exactly the kill-your-fellow-video-player-for-a-copy mania of STREET FIGHTER II for the SNES (grin), but enough for them to order more copies.

I am an avid atari user but as far as portables go the Mac wins. The new Powerbook 145 is a 25 Mhz '030 with the backlit supertwist LCD screen and 4Mb RAM, 80 Mb HD for $2689 Canadian. This machine is more than 3 times as fast as the STBook, supports VM and can run system 7. The STBook isn't even close in this race.

This is bizzarre. The problem you are talking about is the same one I have had on the Macintosh but not the PC (haven't tried it with my MSTe). My dial-up UNIX access to the Internet is at 7-E-1. When I try to download something from the unix box to my macintosh, the only protocol that works is Kermit, which uses 7-bit bytes so this is fine. On my PC however, I can use XYZ to get files even though I am only using 7 data bits. Why is this???

When you download a .SIT file onto a PC disk, even if you use AFE to transfer it to the Mac, some other things are still not right. For one thing the 'owner' of the file is now 'MDOS' which refers to the file coming from a DOS formatted disk. I would suspect that that this needs to be changed to the proper owner for Unstuffit (using ResEdit, don't ask me how to use it I don't know either!). I have encountered these problems as well but still \ haven't been able to do it but have been told that this is how to do it. If you solve this problem, please post your findings.

True, darek has supported the atari community in the past very well, but his latest comments irk me. His gemulator product may be a fine technological acheivment but how many PC users want to emulate an ST? I find his comments on the Falcon totally non productive. If you don't like the atari market anymore, maybe you should apply for a job at Microsoft or Borland. I happen to think the Falcon is an exciting machine and I look forward to adding it to my desktop.

> **Trust in your calling, make sure your calling is true**

Sure I have seen this: if you wanna see that something, just look behind !
Seriously: you can know when it is gonna come: the floppy suddenly,spins up pointless, several times. Now, you have to be prepared to resist the attack. cast the spell:

'save on disk'

Then, when the something appears, you're unlikely to kill him, but he is very likely to kill you. BUT don't worry: there is a cure. It consists in a second spell:

'press reset and reboot'

If this a bit too tricky, just try to send back your disk: it is generally due to a disk failure !

2349. More TT030 help...

Newsgroup: comp.sys.atari.st
Date: 1992-09-04 04:26:09 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Sep4.042609.12758@u.washington.edu>
Source record: 217855

I just bought an 8 meg TT. I have a hundred zillion questions, but I'll start off with 2...

1) How do you use the Fast RAM? All memory tests show I only have 4, which I can understand, but when I run Calamus and load all my 130 fonts it says I'm out of memory (I know that's only 4 megs because I could load most of my fonts on my 4 meg Mega STe). Do I have to set a bit on the programs I want to make use of Fast RAM? How do I do that?

2) Screen trouble(?). My TT Medium res screen is supposed to be 640X400 16 colors, right? Well... mine's 640X480! Don't ask me how! No graphics board; the VME slot is empty. I have about an inch of extra space at the bottom of my screen. I'm not complaining..., except that the desktop is shifted/squished a bit to the left of the white illuminated area, making things look *slightly* skinnier. (BTW that's NOT the source of the extra room at the bottom of the screen; there are actually MORE pixels! The 640X480 only happens in TT Medium, but the shift is there in all resolutions.) Will a graphics board help this? Are there any halfway decent VME graphics boards that are less than Crazy Dots?

Thanks...

Dan Aylward

In your post, you say that the latest Mac LC (the LCII) is better that the Falcon. Where do you get this from? The LCII is a 16 Mhz '030 : tie. It will support 16-bit graphics but only up to a 13" monitor...for mor color/resolution you need a graphics card. The Falcon's sound just kill the LCII. The LCII is in direct comptetion with the Falcon, not the Classic II, plus the Falcon is cheaper. The only thing that the LCII has is a superior O/S but TOS is getting better.

>So, it shows that the distributers were confident in it, but it doesn't
>say anything about how well the game has sold. I would really like to know
>how well it is selling to the consumer.

That is true! But when games survey of stores show Lynx Batman
is TOP 10 SELLER then it is showing very large number sold.
If number one game is selling in millions then Lynx Batman
is around 2 MILLION sales for sure!

Game developers making less and less software for Amigas and ST but
supporting Lynx so it is sure sign is it money maker. Atari
will make more money because of Asteroids/Missile Command licence
to Gameboy too.

Just to clarify a little... It's available if you bought the magazine or
presumably a back-issue. It's _not_ PD just because it's appeared on a
magazine disk.

>

Firstly, Atari already churn out IBM PC clowns, the ABC range of computers.

Secondly, for the Atari non-intel based machines to be taken seriously at
all they have to run a set of de facto standard software. It doesn't really
matter if the Atari specific software is more powerful or even cheaper, it's
just a fact of life. The only way I can see for this to happen is to produce
and release to developers an interface library which will allow them to just
compile and sell their code from another machine. Maybe the interface
library could emulate the MAC-OS system calls (though I guess Apple would
have something to say about that).

> I may be wrong on this...

I believe you are.. at least in the case of the Mac, and I think MS-Windows is the same. The application gives the "OS" a description of the document to be printed. The "OS" then gives this to the printer driver which does the conversion to a format the printer understands and sends it to the printer via whatever means the user has selected. ie. It could be a postscript printer being controlled by a card in the VMEbus slot at the back of a TT. It doesn't matter too hoots to the application where the data's going to.

This is in fact what GDOS does too. When you don't have GDOS loaded and print something from, say, the desktop the program has to do all the hard work for itself.

2363. fontgdos problem

Newsgroup: comp.sys.atari.st
Date: 1992-09-04 11:13:57 UTC
From: jtreichl@iiic.ethz.ch
Message-ID: <1992Sep4.111357.15609@neptune.inf.ethz.ch>
Source record: 217876

I have a problem with the fontgdos. probably i missed the discussion about
the it.

1. i installed the cpx modules and generated the assign.sys and
the extend.sys file. they seem to be correct.

2. put fontgdos.prg in the auto folder an boot.

3. i wrote a little test programm with a vst_load_font call for
the screen device.
GDos error: not enough cache memory.
but i have set the cache sizes on 20,20,200 and no font is bigger
than 60kByte.

what's wrong.

Source record: 217873

The STacy + GCR and the likely ST Book + GCR combos lack two of the most important features which make the Powerbook the best machine to get:

Nearly instant connection to networks when you are using System 7

and

The network of Apple service centers to repair the machine when it breaks.

In <1992Sep04.085511.23890@bas-a.bcc.ac.uk> ucacmsu@ucl.ac.uk (Mr Stephen R Usher) writes:

>Secondly, for the Atari non-intel based machines to be taken seriously at
>all they have to run a set of de facto standard software. It doesn't really
>matter if the Atari specific software is more powerful or even cheaper, it's
>just a fact of life.

If it doesn't really matter, then why should anyone have an ST
instead of a PC or Mac? The software for the 680x0 Ataris
generally has a much better performance/price ratio than the
software for any other platform. Some pieces of ST software are
without counterparts on any other system, and the best thing
about it is that some of that stuff is even free! To me, that
makes a big difference.
If you want to use "de facto standard software", get yourself a
"de facto standard machine". If you want something better, have
an Atari. But don't expect that to be 100% problem free. As
someone has once stated: "Many who have been ahead of their time
had to wait for it in uncomfortable shelters."

>The only way I can see for this to happen is to produce
>and release to developers an interface library which will allow them to just
>compile and sell their code from another machine. Maybe the interface
>library could emulate the MAC-OS system calls (though I guess Apple would
>have something to say about that).

Creating libraries is usually something the developers do for
themselves. If they program in a too system-specific, unportable
way, this is their problem. Atari for developing their own OS,
not for emulating others.

I received the following request from a user at Concordia University.
If any netter has info, please E-mail a message to me. Thanks.
==========

I have a TT that I would like to connect to an
Ethernet network. In May, Atari Canada told me that they had an
ethernet card (the Riebl-Card plus) along with ST/X-windows that
would do very nicely. I would very much appreciate any information you can
give me about this.

2369. Info needed on Portfolio display control

Newsgroup: comp.sys.atari.st
Date: 1992-09-04 12:34:13 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <4SEP92.08341351@cc4.crl.aecl.ca>
Source record: 217879

I received the following request from a local company that does not have
net access. Please forward any info to me so I can help these guys. Thanks
==========

Atari Portfolio Display

The BIOS on the ATARI PORTFOLIO allows the user control of individual
pixels on the LCD display, but for real time programming, the
BIOS calls are dreadfully slow in execution. Unfortunately,
ATARI does not support direct manipulation of the hardware by
users, and the hardware is distinctly different from the standard
types used on PC's.

Somewhere out there, there must be some users who have figured out
how to manipulate the PORTFOLIO display at the direct hardware
level, and perhaps would be willing to give me the following
information:

1) What is the address of
a) the status port
b) the control port
c) the data port ?

2) What are the individual bits in the status byte used for?

3) What is the procedure to set/clear individual pixels?

Though I haven't tried it myself yet the documentation of STZip 2.0
says that the created self-extracting archive is still a valid ZIP file
and thus can also be viewed at or extracted by STZip.
Of course if the new inflation algorithm has been used (which is a
necessity for self-extracing files) you cannot use Zip 1.1.

I'm amazed that you guys are still spending so much energy debating about
Atari's vaporware. Granted, some Falcons were seen at the "show" in
Germany. Do I have to remind everyone how many years Atari showcased
the 68020/30 TT before they ever sold one (nobody seems to be buying
them anyway)? They made the same price claims then..."get your 32bit
680X0 box for less than $1000 and blow the doors off your neighbor".
However, when the thing was finally released, the laws of reality
took over and by the time you configured the machine with enough
things to do any real work, it cost just as much or more than
comparable and better supported products from other companies.
To make matters worse, Atari's development timetable is so far
back from the pack that by the time (except for the original ST)
they get anything out the door it is "has been" technology.

Why would anyone take a risk on such an orphaned machine when
they can run out and buy a 486box for $1500 (unlike Atari,
that includes a few megs of RAM, a decent hard disk, and a
minimum of 800x600 color graphics. And you can go out to ANY
computer store and buy add-in cards, memory, software, etc.

A couple of years ago (above the din of the Atari cheerleaders)
I said that the stock market is generally a good means of
checking out the market's assessment of a company's viability.
Atari's stock has been hanging in the $1.50-$2.00/share range
for almost 2 years. Investors have no confidence in the
survival of the company so why should a consumer have any

confidence in their product line, especially in light of
past fiascos?

Damn, that felt good. Now I'll go back to comp.sys.mac.misc
and put all those Falcon posters in my kill file. :-)

Have a nice day,

Chris

Try using the Mac for a while. If atari had enforced O/S rules like apple does, like the standard 'FILE' and 'EDIT' menus, you would be able to use any application without any new knowledge like you can on the macv (to a certain extent). What it boils down to is that the mac & ST came out at the same time but look at how far the Mac O/S has come compared to TOS. Not only has apple constantly upgradaed and improved all facets of their os, but they have encompassed it all in a single package (especially in system 7). Let's compare adding new fonts: on the mac, you drag the font file(s) to system folder and you're done. On the ST, you have to get into arcane GDOS files like assign.sys and extend.sys.

I would like to disagree with this, at least partially. There are so many
different compression formats on the ST that it really *sucks*, a .sea is
extremely nice because then I don't have to have "X" program or the newest
version of Lharc (which I *never* seem to have).

Those without an ST should just buy one :-)

Well, maybe not, but self-extracting files sure make my life a lot easier.

2376. Atari 1040 STe system For Sale

Newsgroup: comp.sys.atari.st
Date: 1992-09-04 14:53:04 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <swood.715618384@vela>
Source record: 217886
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers

Reducing my price a little on my STe system in hopes that I may get
some money out of it for fall tuition...

Hardware:
=========

Atari 1040 STe w/4 Meg and internal 800K DS/DD drive
stereo sound - 4 joystick/mouse ports (mouse included)
320x200x512 low, 640x200x4 med, 640x400x2 hi-mono resolution(s)
Parallel, serial, DMA, and monitor ports - RF out for T.V{
External Atari SF 354 SS/DD 400K 3 1/2" drive and powersupply
2 joysticks & 2 joystick/mouse extension cables
NAP amber analog monitor and connection cable
Royal LetterMaster daisy wheel printer and 10' printer cable
desktop table support

Books:
======

Compute's ST Programmer's Guide
Abacus (partial series 2,3,4,5,6,10,11,12)
6502 Assembly Language Programming (for use with xfmr 6502 emulator)

Software:
=========

LDW Power Spreadsheet (VP Planner clone for ST - lotus comp)
dBMAN V (database III+ clone for ST)
Flight Simulator II (color version for STe)
MichTron SuperConductor music sequencer
Mig 29 Fulcrum (russion fighter pilot simulator - good, comes with book
on the Mig with nice color photos and information)

I still have the original boxes for the computer, and have about 100-150
disks of PD/shareware stuff that is yours for the taking - I also am a
volunteer archiver at atari.archive.umich.edu, so if you need anything
from there, I can put it on disk for you before I send.
Among one of the features that I have for the system, is the worlds largest
collection of swimsuit and adult pictures (Spectrum 512 format) for the ST.
I won't need em anymore, so they are yours with the system. The printer
has been added on since the last post, so the price has only
come down a little.

Asking $500 or make me an offer (I get more desperate the closer to the 14th.)

2377. Can I un-arc MSDOS files on an ST?

Newsgroup: comp.sys.atari.st
Date: 1992-09-04 15:09:13 UTC
From: ganderso@unlinfo.unl.edu
Message-ID: <1992Sep4.150913.17933@unlinfo.unl.edu>
Source record: 217888

I want to get some games via FTP for my young nephew who has an
IBM machine. My machine is an Atari ST.

Can I un-arc these IBM files on my ST, as I would an ST file? Or will
I need special software? Or can I even do it at all?

(I know the easiest thing would be to get the files and the appropriate
unarc program and let him do it, but I know the procedure would
confuse him even more than it's confusing me...)

Thanks!

Gary Anderson
ganderso@unlinfo.unl.edu

>getting better.
>

I thought the LC and LCII could only support _8_ bit color (256 simultaneous) on Apple's 12 inch monitor and 16 colors on the 13" units. To get 256 colors on a 13" you need to add more VRAM. Isn't this right or did Apple improve video specs on the LCII? It _could_ be a nice machine if but for that 16 bit data path!!!

I think the Falcon should indeed be superior to the LCII (even disregarding the Falcon's vastly superior sound capabilities) but then again, there is that huge software base for the Mac made possible because Apple _advertises_! And don't forget about the more powerful but lower cost 68030 machines Apple has announced for availability later this year; some with built-in CD-ROM too.

As a developer, I'm just curious... how many folks in this newsgroup actually do intend to buy a Falcon when (and if) they become readily available at say, about US$799 for a 1Mb, _no_ hard drive model (which will _not_ multitask in this configuration)? How much will a 4Mb, 65Mb HD model cost? Atari has not released pricing info yet but if $799 is about right for the low end, we would surely be talking about $1299 or so, don't you think? And you'll also need a VGA monitor.

So how many _really_ intend to buy one?

Can one actually purchase it now? Is it for public sale or for developer's
only? I'm am told by a local dealer that it's still for sale only for developer's
here in the U.S. The dealer did give me an expected price and it is outrageous.
I expected it to be expensive but not -that- expensive. And I hope that
it will be available in color as I do not wish to pay more for a monochrome
monitor.

>programs I want to make use of Fast RAM? How do I do that?
>

Some of the old system diagnostic programs don't recognize TT RAM. Your best bet is to check the General Setup CPX, and hit the Status button.

There is a bit, like the fastload bit, that must be set for programs to load and use TT RAM. PRGFLAGS from Atari works. There's also a CPX that lets you change them, although I find that it doesn't always let you change the bits on some programs (for whatever weird reason).

>2) Screen trouble(?). My TT Medium res screen is supposed to be 640X400

>decent VME graphics boards that are less than Crazy Dots?

TT med res is 640x480. :^) Nothing's wrong. :^)

What monitor are you using? On my NEC 3D the screen is squished too. I understand that this only happens with some monitors; I had thought it was only on the 3D.

The AlberTT board will give you 1024x768 with 16 colors. I think it's around $600. Not as expensive as a Crazy Dots, and not as colorful either. You might want to save your pennies for a Crazy Dots though. I hear they're worth every cent.

> for internal expansion.

First, please use a carriage-return at the end of a (80) colomn - other
wise it is hard to edit through your comments to address the issues you raise.
Second, the Falcon is not up to the sheer power (MIPS, whatever) or
features (ISA/EISA/whatever) of a "high end business system". Lets put aside
quibbles about what is/is not a "high end business system" (I mean, how many
MIPS does your machine need to run at to process a 1-2-3 file, or to use Word
Perfect (for windows even!) or to run cash-register software? Not much).
However, it is not targeted for that market (or ever will be for that matter).
True, it does lack a standard expansion bus, but it does have some
expandibility due to the external ports (SCSI2/RS232C/RS242/Centronics/VGA)
and the PDS (when someone makes something for it).

2) For features it rivals NOTE!! The latest Apple Lc
> and surpasses it in features by a longshot. It's rivals are the Mac Classic I
> I and 386 Sx's.It beats the Classic in price,features and performance and
> beats the SX's in sound,I/O,price, and frames/sec but not in video
> resolution.

A better ApplesNOrganges comparison (rather than an AppleNMango) would
be the Falcon and a 386-20 w/Windows3.1/SoundBlasterPro/SCSI-2Card/MultiIO.
When they finally get Multi-TOS out the door, you'd have to add either
Windows NT or OS-2. The closest Apple would be one of the new ones coming out
(the MacIIuv or something...I forget).

[promotion complaints deleted...even if valid]

>>And Atari didn't show any STEs.
>So what's new, would you show a system that HAS THE POTENTIAL OF BECOMING A DOG

Well, that would be like IBM showing ads with IBM PCXT in it. :)

>NOTE a) the Falcon 040 is going to be a souped up TT + 040+ Falcon features.

Hey, how do you know that? I mean, I sure hope it is configured like
that (I ain't gonna hold my breath), but do you know something the rest of us
don't?

>b) Atari is yet to scr*w up it's users again so don't be hasty to crave for a
[Stuff about wanting a 386+'387 being bad deleted - couldn't wade through
all that text without returns]

Actually, Falcon will only support 386sx (bummer) but there is nothing wrong with wanting to have the capability of incorporating a '386 (and thus its software) into the Atari. Mind, if that is all you use, you bought the wrong computer, but for those who don't want to own two separate computers/ monitors/etc. it is a good way to go.

Calamus can not use TT-ram. BUT, things like AHDI (harddiskdriver),
CACHExxx.PRG, FOLDERxxx.PRG and other applications in the AUTO folder
can be loaded to TT-RAM, giving you more free ST ram. Also accessories
may be loaded into TT-RAM.
To get a program (or ACC) to load into TT-RAM you either use one off the
many utilities specially made for this, or you use a fileeditor. The first
aproach is the easiest. There is a CPX module around (FILEINFO.CPX I think
it's caled), and there is a ACC around (SETFLAG.ACC). The second approach
is a litle more complicated:
It is byte no. 26 (counting first byte as 1) that holds the program flags.
Note that most file-editors count the first byte as 0.
Bit 0 is the fastload flag
Bit 1 is the 'malloc' flag (malloc from ST (unset) or TT (set) ram.)
Bit 2 is the 'load' flag (Load program to ------------ " ------------)

You have to try out the different combinations to decide wheter a program can
use the TT-ram. Surprisingly many programs does run well in TT-ram (but not
Calmus).
Newer profesional programs (like Calamus SL, Cranach etc.) use both kind of
ram. I've seen Cranach report over 256Mb (Yeah 256MEGABYTE) free on a TT!!!

>2) Screen trouble(?). My TT Medium res screen is supposed to be 640X400

|>
|> So how many _really_ intend to buy one?

I spend all day working with computers, so I don't go home and hack with them very much anymore. However, the Falcon could be a KILLER video game machine, that will do lots of other things if the need arises.

My baseline for games (that I have played so far) is 'Chuck Yeagars Air Combat'. If I see a combat simulator that is as good or better than that, another really good game or two, and it will run some decent productivity software, I will buy one.

Around here, a 386-25/4Mb/80M HD/SVga machine is ~$1500 CDN. The Falcon looks to be fairly price-competitive with that. (a small price premium is fine, because I hate PC's. And, if I ever find the time or inclination to go back to hacking at home, it sure as hell won't be on a PC)

Well, developer-dudes (and damsels?), I am waiting. (And I don't mind spending money on GOOD software!)

If you are numbering levels in the same way that I am, I think that level six would be a wide open level. In that case, if your characters are dying in an explosion, It's probably not some monster but some stray fireball that's doing it. Hint: watch the blue fields. (from a safe distance.)

Actually, to get "Thousands" of colors (4096 I guess), you just add Ram the
built in video!

I don't agree with your comment about the superior OS, I find the Mac OS
extremely user friendly, and *extremely* slow, and *extremely* limited. I
perfer the ST's O/S better in almost all cases...

Of course, I have something about a computer that can actually corrupt its own
operating system like the Mac likes to do also, seems like something should be
done about that!

Wow, faster than Uniterm? Really? Maybe I should see that...:)

>Wolfgang, the Connect author also suggested that I have gdos or Nvdi or
>something like that. I don't have either at the moment.

The good thing is that they should both be up at Atari.archive. The bad thing is that it takes time to download/setup/etc. Oh well... You should probably get at least FontGDOS. If you don't use it for you term progs, you could always use it for word processing.

Later,

Mike

Wait! I've got it:

Darek slags Atari off in other computer groups, while at the same time promoting HIS Atari ST (and Falcon) emulator. Old and new Atari users abandon Atari Corp. in favour of BraSoft's emulator. Atari goes bankrupt do to zero sales, while BraSoft flourishes. Bingo! Darek becomes defacto president of defacto Atari (BraSoft)!

It all makes so much sense! Why didn't I see it before?!

Seriously, what is Darek's problem? Did someone at Atari Corp. do him wrong some time ago, and he never got over it? BTW, if Darek is going to make such statements about Atari, why doesn't he have the guts to make them here?

Flames off...we not return you to your regular programming...

>I remember to have read that you could replace a 486DX with a 486DX2 and gain
>som real increase in performance, without changing the clock frequency in the
>machin!?!?

Just FYI, Intel's DX2 chips are known as "clock doublers" in that they internally double the effective clock speed of the DX chip. Hence, a 486-DX33 can operate at 66MHz with the addition of the DX2 chip. What's nice about this arrangement is that the system components don't necessarily have to be rated for a 66MHz cpu which keeps costs _much_ less than what a "true" 66DX layout would cost. The downside is that vendors must be careful about architecture due to heat problems and only your real CPU intensive tasks benefit greatly from the DX2. Still, the overall throughput is such that a DX2 should provide about 85% the speed of a DX for just a few hundred bucks more. Quite a savings so it is no wonder that the PC community is excited about this technology... a 66MHz machine for less than the cost of last year's 33MHz barn stormer ain't bad (even if it IS a PC). :)

Unfortunately (?), Motorola chips were not built with the flawed design that allows Intel to come up with a clock doubler chip in the first place. :)

>
>So how many _really_ intend to buy one?

Well, to be honest, I probably will not buy one. The only reason is
that I have a TT, and it would not make sense to downgrade my processor speed
(and lack of VME, and no separate keyboard) when I won't really be using
the increased sound capabilities or the increased video capabilities.

The people who would be most attracted to the Falcon should be either
a) musicians, b) first time buyers, c) those who are upgrading from a 520/1040/
1040STe/megaST/MegaSTe(maybe).

Now a '040 Falcon designed along the lines of a TT would be another
matter TOTALLY!!

Well, if STzip is anything like the IBM zip, the self-extraction
arc should be able to be treated just like any other zip file - self-extraction
is not necessary, but is convienient. In fact, it sounds like a port of the
code, so I wouldn't be surprised if the IBM/UNIX zip works just fine on it.

My budget doesn't allow an answer to the question just now, but then they aren't on the shelves just yet. What I can say is that I find the Falcon very attractive. It appears to have a very interesting mix of features for the price. I say this even realizing that I will need to spend a good deal more than $700 for what I will want in memory, hard disk space, and screen. Of course, I say this partially because I have a lot of effort put into setting up my current system (Uniterm, TeX, etc.), and the fact that most of my software may just run is seen as an advantage. Given that I have a few months before I have enough money to allow a decision, I will probably do what everyone should do when considering a computer purchase --- set a budget and buy the machine/software combination that best meets my needs/wants. And it looks like the Falcon may very well be that machine. Then again, if they offer a version with a separate keyboard and a faster CPU, that might be the machine I should buy.

><X>orcist

No, it mixes down 8 channels into 2 channels out the audio output.
Using the DSP port and an external device you can have 8 discrete
channels. The limitation is that the Falcon only has 2 DAC's (or 1
stereo DAC).

Have you tried FreezeDried (FZDTerm)? I don't know if it support Kermit
but I know it supports just about every other type of down/upload
protocall. Also, since the transfer protocall are not built into the
program but are external modules, any stand alone tranfer protocall can
be used.

Their is a demo version of the Shareware program on just about every
BBS board I can think of. The program cost $25.00 and is available
through its author, Aaron Hopkins. By the way, it might interest you
to know that Mr. Hopkins is (I think) 17 years old. He's written,
what I believe to be, one of the best telecommunications program out
for the ST at the present time.

Just this persons humble opinion.....

You should really contact Atari on this issue if you're really interested
in running Unix on your TT. I wouldn't expect a dealer to know much about
it since it probably wouldn't be distributed in the normal dealer channels.
Some of the dealers I know don't know much about the Atari machines they
sell, not to mention Unix. :^)

> So how many _really_ intend to buy one?

My next computer, aside from a cheapo 520 to use as a terminal, will either be a Mac LC2 or a Falcon. Which one depends on several things - the availability of a detachable keyboard (I've grown used to typing with my keyboard in my lap from a recliner) - how good the graphics are - how well it multitasks (does it crash whilst running my favorite apps? And will new versions come out if they do?).

The HD isn't much of a problem for me, as I intend to buy a small HD to run my BBS on, and put that on the old computer, and use my current 105MB HD... The monitor I already have (the BBS can run on a TV set). So my total cost would be perhaps $1100 for a Falcon.

If I bought a Mac LC2, I'd be paying well over $2000 for a similar system, and I still wouldn't have the digital sound capabilities that I'd like to have.

By the way, another post asked why so few people seem to like the GEM O/S... Mainly because it's only a short step better than MS-DOS, is my answer. MultiTOS, if it turns out nicely, will be far better than Sys7, which is, IMHO, a poor excuse for an OS. I would like to have a multi-user system, but... <sigh>

This make no sence! The 25Mhz version of the 040 does 20MIPS. If a cklock
frequency more than two times higher only yields 25% increase, I'd be
realy disapointed.
No, the thing is that this processor actually runs at 33MHz, but it has a
onboard clock-doubler wich make the internal clock 66MHz. This is the same
trick as done on the Intel DXII processors!

This shows that he has a "vested interest" in denigrating the Falcon.
The fact that he COULD be correct gets obscured by this...

>>Let the buyer beware. If you think Atari claims and service are
>>bad, be prepared for worse with this guy. You don't have to conduct
>>a survey to find plenty of people who have been burned by him. He's
>>bailed on Atari. He's sold his Quick ST software rights to Codehead,
>>and is a PC developer now.

Better that than to just run out on us! At least he sold QST to
someone reputable - he could have dropped it just as easily. I think
EVERYBODY won in the QST/Warp 9 changeover.

>It's a good thing he sold Quick ST to the Codeheads after screwing
>everyone over with his own last VERY buggy version. I'd like to
>reiterate that "buyer beware" warning concerning Darek and BraSoft.
>Talk about an attitude!? Sheesh!

I think that Darek would get a LOT further if he could sometimes just
clamp his mouth (keyboard?) shut, and say NOTHING. Unfortunately, he
has a tendancy to try to add some "political" content to his
advertising, which tends to be self-defeating. He's definitely a
skilled programmer (polished might be a different story). He's
produced quite a lot of USEFUL software. It's too bad that he keeps
shooting himself in the foot by denigrating Atari users. I think he
missed that lesson about "If you can't say anything nice, don't say
anything at all!"

It's certainly bad for marketing!

Source record: 218034

By using the "Adobe Illustrator" import driver, you can easily make
your own programs to create vector graphics with simple ASCII files.

Put these 4 lines of ASCII text at the beginning of your vector
graphics file:

```
%!PS-Adobe
%%Creator: Adobe Illustrator
%%BoundingBox: 0 0 100 100
%%EndSetup
```

(yes, it looks like PostScript, but PageStream can also import it
as normal line graphics for those of us without PostScript printers)

Then to set the line width to say 0.5pt, add this line

```
0.5 w
```

Then to use black lines, add this line (1=white):

```
0 G
```

Then to set the line ends to squares, add these 2 lines (1=rounded):

```
0 j
0 J
```

Now, to move to a point say (100.5,300.0) (in pt), use:

```
100.5 300 m
```

And to draw a line from the last move or line point to (20,50), use:

```
20 50 l
```

At the end of each polyline (a sequence of moves and lines), add:

```
S
```

Then add this line to the end:

```
%%Trailer
```

Simple! The caveats are:

1) You'll have to set the line width and colour, because the
defaults are 0pt and white.

2) You MUST end shapes with "S", otherwise they will not show up.

3) PageStream has a limit to the number of points in a shape, so
make sure you divide your vector graphics up into
sufficient shapes.

and, I'm not sure, but probably:

4) Line widths/ends don't work mid-way through drawing a shape.

I have trivial C++ code for this, if anyone cannot follow. And a cool
Fractal Tree drawer - which is my reason for finding this out :-)

I simply used a slightly modified version of the format generated by
GNUplot's AIFM driver... if you fix that driver, you could easily use
GNUplot to generate graphs, etc for inclusion into PageStream!

- Have you tried FreezeDried (FZDTerm)? I don't know if it support Kermit
- but I know it supports just about every other type of down/upload
- protocall. Also, since the transfer protocall are not built into the
- program but are external modules, any stand alone tranfer protocall can
- be used.
-

You might also want to try ShadowTerm II, which is availableon GEnie. It is Shareware, but costs less than Freeze Dried Terminal, and it also supports external protocols. It will run on a 520ST, so memory is not a problem. The demonstration version available on GEnie has everything enabled so that you can look around, and a thirty minute time limit. One of the main advantages that ShadowTerm II has over Freeze Dried Terminal is a GEM interface. It is easy to get at your accessories. I would say that it matches up with Freeze Dried Terminal in all other areas with the exception of emulations. ShadowTerm II does not do any yet.

If you do not have a GEnie account, you can get the program directly from me. E-Mail me for information on that.

And the fact that FreeZe-Dried has background dialling, Flash .DO file compatibility, built in text editor, fully configurable scroll-back. fully configurable ascii sending. Automatic login learning. Anti-timeout signals. 48/50 line screen on monochrome systems. resolution independancy. Status bar giving all configurable information, and an on-line timer. Toggle keyclick/system bell on/off. Background event relay. Different fonts (loadable). Quick to use non-GEM user interface (much faster than GEM). Keyboard shortcuts for virtually all on-line commands. Keyboard selection of menu items.

v3.0 of FZDSterm is gonna have more emulations (with luck VT100) built in protocols, etc. etc. (Maybe!!)

Also, using shadowterm on TOS1.2 using the standard GEM file-selector, it won't read the information from the disk, and locks up completely!

(No ACC's or TSR's loaded)

But, when Universal-Item-Selector III is loaded, it works!

>place to ask this question would be in one of the "windows" newsgroups.
>Anyways, Windows 3.0 should work fine on a AT Speed C16...
>

If you replaced the number "286" in the above paragraph with
"8088/8086", then you would be correct. Windows 3.1 will run on a
286, but not on an 8086 or below (it requires protected mode). If you
have a 386, then I believe 3.1 will load a separate kernel that has
some 32-bit code in it and other enhancements.

Source record: 218023

The latest edition of Bill Aycock's calendar program, version 6.3, was just released. I've put it up at atari.archive.umich.edu, in /atari/new/cal63.zoo.

As is typical, the database format has changed slightly. As is also typical, there's quite a few improvements. This program just keeps getting better!

Notables changes: (IMHO: Others might find some of the other changes notable...)
(1) You can select more than one weekday for an event, i.e. - you can have a class Mon. and Wed.
(2) Certain events can indicate Holidays. Other events can be cancelled/deferred based on the holiday.
(3) There's now a set of CLI options for those that run CalShow from a cli.

Shareware that's well worth registering! I've seen EXPENSIVE stuff on PCs that's not nearly as nice as this...

> Ah, but of course! Command-. why didn't I think of that logical keysequence :

Granted, the Mac operating system has its quirks (don't they all?), but
I think you will have a hard time showing that its quirkiness comes close
to rivaling that of TOS. The ease of use and the standardized menu of
most applications is probably one of the main reasons that the Mac
clobbers the Atari line in sales of machines in spite of the huge
price differential (actually the price differential is narrowing
quickly).

For example:

In today's New York Times, there is an ad from J&R Music World
for a Mac Classic II for $1199. For that you get:

68030-16mhz mpu
4mb RAM
40mb hard disk
keyboard
(hi rez mono monitor built in)

That is $400 more than the indicated price of the Falcon and for
that extra money you get 3mb more RAM, monitor, hard disk, and
stable system software. ...not to mention the thousands of software
titles available off the shelf (instead of hunting all over town for
a music store with a few game titles).

Regards,

Chris

>includes Codehead docs for NewDesk. The Icon Juggler is not an icon editor
>though; it edits the DESKICON.RSC. I'm pretty sure you can only move icons
>around, assign them to different files, and import icons from other files.

Icon Juggler only has the options to set and delete pixel and move the icon;
a real icon editor offers some more features. If you want to see a good icon
editor, look for Iconedi 3.07 by Stefan Muench (I think that's the program Steve
wanted). Features: Icon and Image editor, maximum size 640x400 dots, all
neccessary elements like lines, squares, rectangles, circles, ellipses, circle
& ellipse parts, automatic import of icons/images from resource files, export
of icons as a resource file, etc., etc...

In the current version, Iconedi can't edited any resource file directly, you
have to import the icons, modify them, save the edited icons as a resource
and merge them into the resource file using a normal resource construction set.
This will change in the next version.
/s/ Udo
PS: contact address: Stefan_Muench@un.maus.de
PPS: Iconedi is shareware (~ $15), docs are in german (that will change, too)

Daniel,

You can use KA9Q which is very good for packet radio, but I do not
know what FTP site it is on sorry. I got my copy from GEnie.

You can also use any normal terminal program if you do not want to
use KISS (slip/ip).

OS/2's HPFS Filesystem is for harddrives only, because it only reaches best efficiency on partitions >= 60 MB. So OS/2-diskettes are still in MS-DOS-format and can be read by the Atari ST/TT!

> software for any other platform. Some pieces of ST software are
> without counterparts on any other system, and the best thing
> about it is that some of that stuff is even free! To me, that
> makes a big difference.

I was recently visiting a local computer store that had Mac and PC software. I was struck by the number of titles for both and the low prices for the PC software. The prices for the PC software were not different from the prices for the ST software.

I also recently downloaded Castle Wolfenstein 3-D from GEnie. The 3-D real-time graphics in this game make Dungeon Master look silly. I had a problem clearing memory in my girlfriend's PC, because Wolfenstein took almost 600 K (out of 640K). The program was running on a '386.

My point is that the Atari can't stand on software (obviously) or even architecture anymore. 1985 was a good year since the ST blew away any 8086 machine, but now everyone has a '386 in the PC arena, but most Atari users are still using a 68000 at 8 mhtz.

The Falcon in not going to put Atari in the same position as the ST did seven years ago. That chance is lost. If many sell AND the DSP is used effectively we could have a popular machine again.

> As someone has once stated: "Many who have been ahead of their time
> had to wait for it in uncomfortable shelters."

OK. If this applies to us, maybe we can feel better about it. I just hope the $799 I spend won't be in vain.

2437. VIKING MONITOR FOR SALE!!

Newsgroup: comp.sys.atari.st
Date: 1992-09-10 01:35:18 UTC
From: joeadato@tcpbbs.pcn.org
Message-ID: <JL4uqB1w164w@tcpbbs.pcn.org>
Source record: 217813

19" Viking Moniterm monitor for sale complete with MegaST graphic card. Asking price is $800.00. This monitor can only be used in the Mega ST (not MegaSTE or 1040) computers. If interested call B&G Electronics 1-(216)-521-2855, or send Email to joeadato@tcpbbs.pcn.org. This monitor is in great shape and was hardly used.

2438. Re: What WP is compat with PC stuff

WordPerfect 5.x for the IBM will accept an Atari WordPerfect 4.1 document file. In other words, you can create you document on an Atari using Atari's version of WordPerfect (version 4.1) copy to file to disk, and then insert that disk into you IBM running WordPerfect 5.1 and it will be read without any problem.

You can also create your document in TimeWorks WordWriter ST, save the file and then use the conversion program in WordPerfect (Atari version) to convert it the WordPerfect version 4.1. After that it will be a WordPerfect file and my instructions for WordPerfect will apply.

> wondering--
>

Lets see.. There's SuperCharger, an external XT emulator with a meg of its own RAM. Then there are the 286 emulator (have to be installed inside your ST) AT Once and AT-Speed C16 and a 386 emulator AT-Speed 386 (also has to be installed inside your ST).

Does that answer your question??

If it is not a problem of too little memory, wait for an update. It should be
due anytime now, and it _should_ work fully under MiNT/MTOS.

What is the "best" public domain communication program? I have been using Uniterm for several years now and I like it a lot. But I do not know any other programs. I have seen that in a.a.u.e there are a lot of these programs around, just too much to try them all. Can anyone recommend me some?

Greetings,

: play MODs at random, say from a given disk. Is there such a thing?
: Also, just out of curiosity, what is everyone's favorite MOD player?
: Thanks for any info!
:
:
: Kevin
:

Greetings- Personally, I'd like something like this for MIDI files (any format) which works as a DA or a background process. That way, I could have real(-ish) music playing whilst word processing, backing up and so on. The CodeHead MIDI Spy demo does some of this, but is limited to about 15k files (I'd need 100k plus) and about 10 minutes usage. The full version could do it, but I don't need the other facilities, such as permanent recording. All I need is something which churns out data to the MIDI ports. Anything like this around?

>younger brother is always trying to play games.

>So, I started looking for another second hand ST and a hard drive. Then I heard
>of the Falcon. The 4 meg version with hard disk sounds just like what I am
>looking for but it will probably be right on the limit of my budget.

>A few questions about the Falcon....

>Will software from the ST work with the Falcon? (Specifically Timeworks 2 and
>games)

Any decent program should run. If it works on the TT, it will probably
work on the Falcon, too. Games are a bit of a problem, since they
often use dirty tricks for speed increase. Anyway, IF they would run,
they would not use the extra possibilities (sounds, graphics) so you
should get some Falcon-specific games. They should be QUITE nice.

>Will this software run any faster (what it actually feels like rather than
>numbers please) and will it use the DSP or other extras or does it have to be
>rewritten?

Yes, it would certainly be faster. I remember reading somewhere that
average programs run about four times faster on a Falcon than on an
ST. You didn't ask for numbers, but surely a factor four will be
feeling a lot better. Programs written for the Falcon will be faster
than the same programs in ST version, because they will use the better

hardware (the processor in the Falcon isn't only faster, but has more
commands).

>When can I get one and how much will it be (:>)?

Well, you'll have to be patient. The 4M/65M version you mention is
said to cost 1800DM, which should be under 650 pounds (I don't know
the exact currency ratings by heart, forgive me).

>And now some thoughts on Atari...

>I agree with the fact that Atari could do with more (any?) advertising. But
>when I thought about it, and saw some of those posts from amiga owners, I
>realised that I hadn't seen any advertising for any make of computer.
>Maybe everyone's got the same problem...

I've seen a lot of computer ads. None by atari, but they really
should. A few years ago, the average reaction on hearing what type of
computer I own, was a giggle about a games machine. Nowadays, most
people hardly remember ever having heard of them. Bad thing.

>Atari may not be the best company but I don't think they are the worst.
>_Personally_ I would much rather have an Atari than a (games console with
>keyboard) Amiga.

Amiga isn't really THAT bad, you know.

>If I do upgrade to anything else it will be a Archimedes which we use at work.
>(It will not be a PC either, I can't stand them!)

I played with the same though some while ago. The A5000 (not sure
about this number anymore) sounded really good to me.

>Archimedes are a big step up in price though.

Indeed, that's why I decided to wait for the Falcon, which, at that
time, was promised to have a 68040 in it which would outrun an Arc.

>I wish there was more shops which stock Atari stuff. (Maybe the ST's are being
>phased out and replaced by Falcon and TT 030+040's?)

(Don't we all...) Umm, I only know for sure that the MEGA STe is going
to disappear. TT's are still faster than Falcons and I thought they
would remain as high end machines, at least until the Falcon 040.

That is the problem, that there is no way to distinguish what it
was archived with, but in his post, he said he used zip. (I know this
doesn't help the person that goes to atari.archive though.)

> Let's face it, anyone with access to these distributable files will have

> ie. standard formats that can clearly be extracted on-site.

The added code was a little under 5k. I like sea, just for the fact
that after it is downloaded, I don't have to worry about if I'm going to
be able to unarc it or not. I got PERFPICH.TOS from atari.archive, and I
was able to unzip it just fine on our VMS machine here.

But anyone reading BYTE in the last couple of months has seen a
full page Amiga ad! If Atari would like to sell a lot of falcons, they
should get some ads in BYTE and a falcon in the hands of Jerry
Pournelle. Then some people might stand up and here what Atari has to
say.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

This is bullsh*t. (Excusez le mot). I worked at a
company during my vacation where some LASER 286
and 386 were used, with extended (or expanded,
see, what a stupid system?) memory of about 3 MB.
The old programs were too stupid to notice it and
it cost a few days ($$$$$$$!!!!!) to get the thing
set up right. And even now things don't work well.
Now take an Atari. You plug in more memory (or
have it soldered in, those PC slots are a good
idea, true). You take any program, and hey presto!
It uses the memory AUTOMATICALLY. No config.sys.

>major names like Borland, Microsoft, Lotus Corp., and more I might consider
>it since it would have potential. Otherwise, another item for the local
>museum. Your DSP, SCSI-2, 45 trillion color modes are the same arguments
>that 16 year old kids make on Atari Corp. conference in North America called
>"AEO."

Borland OK, but if big nasty ugly Microsoft and Lotus, or maybe even
WordPerfect Corp would lay their hands on poor Atari, I'd have nowhere
else to go but Archimedes. Look here, people who wish to use dogs like
dBASE, WP or Lotus shouldn't but an Atari. We don't want PC software
clones on our nice computer. We want nice, GEM-using, Atari specific
programs, which can import and export to the formats of WP and Lotus,
for example, anyway. The stupid software available for PC's are one of
the main reasons I DON'T WANT ONE. I can tell, I've had to work with
the programs I mentioned. And as I said before, I'd trade WP for even
the oldest version of First Word Plus. (I bet you're thinking of the
many features that one doesn't have and WP does, but I'm talking about
the user interface. And there are many ST wordprocessors which have as
many functions as WP, for less than half the price. Gee, I just
thought of another reason not to buy PC's. Sure, you get a 786-100GHz
machine for under xxx$, but you'll have to spend about the price of
the machine itself for a wordprocessor. Stupid. Unless of course, you
do as many (almost all) PC users and get yourself an illegal copy.)

A bit of a hasy posting, and I'll probably get flamed for it. But I'll
happily sacrifice myself for getting people to understand that Atari

users generally WANT Atari's and their programs, or they'd have bought
a PC in the first place.

I've been surprised by finding out about that too, and I can't
offer any explanation. Could any competent soldering expert
comment on the chances to add a port for an external disk drive?
In principle it should be possible in terms of hardware, I
assume. However, it may be difficult to hack up the Falcon TOS to
deal with the additional drive, if the programmers of the Falcon
TOS assumed there would never be a drive B:

2451. ASV is too expensive (was Re: TT Unix ASV)

Newsgroup: comp.sys.atari.st
Date: 1992-09-10 13:22:16 UTC
From: IFF327@DJUKFA11.BITNET
Message-ID: <92254.152216IFF327@DJUKFA11.BITNET>
Source record: 217806

Due to my opinion, the discussions about ASV go intop the wrong direction:
it's simply to expensive to upgrade a vanilla TT to ASV:
(All prices that follow are german ones - citizen of other countries
might have different experiance):

You need for ASV:

(1) ASV - comes on a 300 MB Fujitsu HD and coasts in Germany according
to the statement of an Atari employee DM 3900 + VAT (i.e. 4450 DM)
ASV is _not_ available on diskettes or tape at present.

(2) a 19 " b/w monitor, if you want to have X-windows, coasts approx.
DM 1700 in Germany.

(3) MORE RAM - you need at least 8 MB (more is better), coasts you
500 DM for an empty third party TT-RAM module plus DM 50 / MB.
So, for 8 MB TT-RAM you need additional DM 900.

(4) A (cheapo) TT - coasts DM 2000 (2MB ST-RAM, no TT-RAM, no HD,
no MONITOR).

So, ASV in a working configuration coasts you approx DM 9000, the pure
upgrade will be around 6000 DM. (if you sell your PTC for DM 500 and your
Atari TT-RAM for additional 500 DM).

THAT IS FAR TOO MUCH. If you want to do UNIX for as little as possible
money, you'd better buy a second hand Sparcstation or SUN 3/60 or a
NeXTstation or a fast PC and run linux (free) or one of the BSD-s
on it. Personally I have decided to sell my TT and buy a used SPARC instead.
This cut down the upgrade coasts from DM 6000 to DM 2500.

Additionally, nobody knows whether there will be available sometimes
UNIX drivers for tape drives, CD drives, trird party graphics cards and
so on.

The TT is a nice computer, but I would not recommand to run ASV on it.

Stefan

P.S. There have been NeXT stations for DM 6000 ....

If you want to go "back" in technology :-), I regularly exchange files between GEM 1st Word Plus on the PC and 1st Word (the original bundled package) on the ST. Some things (like footnotes) don't exchange but I stongly suspect that upgrading to 1st Word Plus on the ST would fix most (if not all) of the remaining items.

Also (although you didn't ask), I have exchanged metafiles between GEM Draw on the PC and Easy-Draw on the ST, with few problems. The major discrepancy is in the font handling (for text) - sometimes works fine, othertimes doesn't.

Finally, I use the DR DOS 6.0 ViewMax shell on the PC controlling TaskMax (task switcher). Since I have a 25 MHz 4 Mb 386DX, I load the GEM/3 desktop twice, run 1st Word Plus on one and Output on the second one - shorter time to print that way.

This setup is fairly high on the compatibility scale but shows its "age" in the feature & technology arena. But I like the environment, becuse it lets me use my ST more than otherwise. And I really prefer to work on the ST.

>now. Thanks for the help, all.

I'm not sure what happened there, but should access to atari.archive
go down, for whatever reason, there are mirrors available for your use.
The most notable would be wuarchive.wustl.edu, /mirrors/archive.umich.edu/atari.

I'm sure there are some in Europe also, but I am unaware of their exact
names.

Be certain to know that you cannot upload to these mirrors. (or maybe
you can, but I'll never see the files).

thanks.

Hi everyone,

a friend of mine (with no Usenet access) is looking for a good
GDOS font editor, preferrably PD or shareware. Please reply by
mail and include information where to get the software from (ftp
sites and the like). I will post a summary.

Greetinx, Jan

If anyone is interested I posted a program I wrote to translate back and forth
between gst .bin files and gcc .o files. It still has some bugs but I figure
I'd post it anyway and see if anyone wants to use it.

Bill

2456. Falcon IS worth buying!

Newsgroup: comp.sys.atari.st
Date: 1992-09-10 15:54:32 UTC
From: 86669629s@csghsg5a.bitnet
Message-ID: <1992Sep10.155433.166@csghsg5a.bitnet>
Source record: 217811

So what is this "Is the Falcon worth buying?"-discussion all about?

It seems to me that the Falcon is going to be a fun-machine--a computer that's exciting to work/play with. Who cares if the new-ultra-super-sonic PC 80x86 (x being a number>4) is faster? I like the Falcon--at least what I've seen 'til now--and I am going to buy one! (Hoping it really will come out [and hoping I will be able to afford it].)

Over and out.

Greetings,
martin rosenkranz

p.s.: I had to post this twice 'cause part of the text was missing the first time... hope it was canceled. :-)

I have to agree with your observation. Things are a bit out of hand here.
It won't do any good to start complaining about people who complain too much,
but I would like to ask some of you posters in this are to take your personal
grievances elsewhere. This area is meant for converstion, not bitching.

2458. IBM mainframe transfer protocol?

Newsgroup: comp.sys.atari.st
Date: 1992-09-10 16:49:37 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1685EA651.C556212@mizzou1.missouri.edu>
Source record: 217819

Does anyone out there know where I can find an executable program for my
local mainframe (an IBM 3090) that will allow me to do file transfer via
modem to my ST with a "nice" protocol such as X, Y, or Z modem?
I have tried rz and sz from atari.archive, but it doesn't work on my mainframe
(not VAX, I guess). Any help would be appreciated, but I'm ignorant about
mianframes, so if I need to post more info, tell me what I should find out.
Thanks!

2459. LOOKNG for ST (2-sided) DRIVE

> recommend me some?

Have a look on connect. The latest version (1.52) was placed today on
a.a.u.e /atari/new.

CoNnect is able to support all ports of your atari at the same time.
You can install baud rates of 38400 57600 ... up to 153600 on a TT or
a MEGA STE.
Its emulations are very bug-free (even more than UniTerms) and the
latest version even supports in addition to vt52, vt100
vt102 (ansi) , vt220 the graphics terminal emulation
TEK 4010.

CoNnect is completely based on GEM and supports many MiNT/MTOS features.

Well, I was at the atari messe in dusseldorf... ...and spoke to
the designer of this accelerator... what happens is that the chip is clocked
at 60 mhz, but the card was running at 33 mhz, and he claimed that next does
something simmilar, hence, they are both the same speed...

by the way, the instructions on how rto make the expansion, will be
published in a magazine(german), in the near future.

Bye, B.S.

2462. Uploaded to Atari Archive

Newsgroup: comp.sys.atari.st
Date: 1992-09-10 17:36:30 UTC
From: seymour@dgbt.doc.ca
Message-ID: <1992Sep10.173630.21000@dgbt.doc.ca>
Source record: 217822

I have uploaded litpuz2.zoo and litpz2gf.zoo to
atari/new to replace litpuz1.zoo in the games directory.

The new version now contains 5 little puzzles which run
only on a colour monitor. The binaries are in litpuz2.zoo
and the GFA Basic 3.5 sources are in litpz2gf.zoo.

BLKPUZ - a difficult sliding block puzzle
ROTATPUZ - something similar to the RUBIC cube but only 2 dimensional
(now made more difficult)
MAZE3D - a maze connected in 3 dimensions.
(now has 4 modes of operation, special graphical effects)
DELIVER - an easy matching puzzle
FIVE - try to get five markers in a row before the computer does.

All of these are freeware but I would be happy to hear your comments.

seymour@dgbt.doc.ca

I think I know what you're looking for. I have a little desktop ACC that plays MIDI songs in the background while I do my word processing. I am not sure how large of a file it can handle, but it may be enough to handle what you want to do. It loads several songs into memory and then plays them in order and repeats itself. It is called 'Music Studio Background Player' and the file name as I have it on my boot drive is MYMSPAC.ACC. It is PD and I have the source code too! It is old though, as is all my wares because I have been out of the ST mainstream for some 3 years now... Oh, it was written by a James Patchell.
If you need it and cannot find it elsewhere, tell me. But I am not going to be able to u/load it for a while, as I have not yet figured out how to u/load or d/load to my local mainframe yet.
If you need more info, just ask!

Where can this program be FTP'ed from? It sounds like it might be a
pretty good term program. Right now I use Interlink, because it has an
external file that you can load and it gives it full ANSI compatibilities
which I find necessary much of the time.

2467. PowerDOS Freeware?

Newsgroup: comp.sys.atari.st

Oh, I just realized I goofed it here... I know that going for TT ram makes it
impossible for the dma (acsi) hardware to accsess the page-immage that Calmus
build up to send to the laserprinter.
But setting Calmus to load to TT ram, and malloc from ST RAM fixes that
problem!

>at all. As a matter of fact, I am running it on a 486/50 MHz DX with 16MB
>RAM and ATI Graphics Ultra. It is as fast as a TT with NVDI loaded in. The

Yes, I've used it, in fact, I can step over right now and use it on a 50mzh 486, I'll grab a window and move it, and I bet it won't be as fast as the ST, I bet it even uses the swap file just to move that little window around, I'll go check and be right back...

OK, well, the screen display *is* snappier than I remembered, but certainly not *faster* than an ST with Quick ST III installed, but I have to admit I may have understated the speed, but not by much! I was absolutely correct about the disk swap, I opened Drive C, grabbed the window, and dragged it into the upper left hand corner of the screen, it accessed the hard drive just to do this.

I can't say I *hate* OS/2 as much as I do Windows, but you must be joking when you say it is "as fast as a TT with NVDI loaded in". :-)

I have written an animation program that rotates images (ie. every pixel). If the DSP could be used as an image rotation engine, then I imagine that realtime animations could be created (now animations are compiled). By the way, the current code uses all integer math (of course), so writing DSP code should not be too tough.

For this to work, the DSP would have to have full speed access to main memory; anyone know if this is so?

>MultiTOS such as screen redraw routines, VDI functions etc. The results are
>definetely slower. If MultiTOS sells nearly as many as OS/2 2.0 copies please
>let me know...

One thing I want to know is *why* everyone seems to equate sales with a good product, it has been shown many times over that what sells an item most is advertising and brand-name-loyalty, not quality. Take for example Microsoft products, OS/2 is far superior to Windows, yet Windows has more applications and sells *many times* more copies than does OS/2. IMHO, *all* Microsoft products suck, as in "bit the big one", you know, they "suck big hairy moose muscles". :-) OK, so, maybe you like Microsoft products, let all take *american cars!*, ooooh, now there's a touchy subject! You can't buy a true "american built" car (actually, many of them are made in Mexico) that can even come remotely close to the reliability of Honda, Toyota, or Nissan, yet the american cars continue to sell better. Even if *you* happen to love american cars, just like the majority of the population, that in no way makes them a *better* product.

In general I've found that the most advertised and popular of products tend to be the ones I like the least. It is the innovative and original products from the smaller companies that actually excel, the others just seem to duplicate...

Anyone else out there know what I mean?

> worked last on. Does it access the HD? Yes, so does every OS.

You've got to be kidding, right? Of course OS/2 is going to fly on
that system! I bet Windows would fly to! But with all this high powered
hardware, you still say "It is as fast as a TT with NVDI loaded in." You
didn't say how much you paid for your system either. Atari has always
tried to shoot for the low-end, and for the vast majority of computer
users, this is what they need.

You have 16MB of ram, but you still need a swap file, and even
then, a 2 meg swap file. What do you use the machine for anyway?

The interesting thing is that Atari still ships very usable one meg
machines with only a floppy drive. I use my ST for everything from DTP,
to word-processing, to programming, to telecommunicating, and still have
only 1 meg of ram and two floppies.

The Falcon, when released, will be the best computing value for the
dollar, nothing else can even come close to its abilities for the
price.

> Is MultiTOS faster? MultiTOS is a FAR inferiour product and doesn't offer 20%
> of all OS/2 functions. I have received some results that were performed with
> MultiTOS such as screen redraw routines, VDI functions etc. The results are
> definetely slower. If MultiTOS sells nearly as many as OS/2 2.0 copies please
> let me know...

Again, this was brought up before, about comparing beta software to
finished products. I think it would be safer to compare Multitos with
OS/2 1.3.

Anyway, the success of the falcon and Atari is going to rely on
their ability to market it correctly. (And we all know how well they can
do that. :-( )

Will I buy one? I will wait and see. The vastly superior sound
systems is what will change my mind, but only if there will be software

that takes advantage of it.

Aw Damn! Hang-on a minute. Gotta put a few more quarters into the modem.
Click *Chink* *Click* *Chink* *Click* *Chink* *Click* *Chink* Okay...

The net messed-up so I don't know who I'm replying to, but....
There's a difference between frequency and sampling frequency.
To sample a sine-wave you need at least twice the frequncy -
the reason is that a sampler takes a snap-shot of the waves
amplitude. So if you sample at the frequency you only get
one part of the sine-wave each time you sample, say the upper
part, thus a DC wave. If you sample at twice the freqency
then you'll get the upper part of the wave and then the lower
part of the wave - thus you can reproduce it accurately.

This only works with cases where you know where the wave is
If you don't know where it is, then you may wind-up sampling
the points of the wave that are at zero - meaning the wave
is hidden. In that case you need to up the sampling freqency.
Between the sampling rates of twice the freqency and four times
the freqency of the sine-wave you get complex phase, frequency,
and amplitude distortions that aren't easy to filter out.

That's why to get the 35KHz wave that the human ear is supposed
to detect you need at least 100KHz or more to reproduce the sound.

P.S. Graph out a sine wave and sampling if you need a model.

Great news !! the 32Mhz 030 of the TT is not that slower than the
50Mhz 486 (even when the 486 has 16MB to deal with)

> Is MultiTOS faster? MultiTOS is a FAR inferiour product and doesn't offer 20%

> Mark K.

Sure, OS/2 is much superior. But it NEEDS a bit more hardware to be
useful ! (I actually think 16MB 486 is a good start)

Oh! It just hit me - the external floppy is no problem - There's a
SCSI2 port, and there are several SCSI-based floppy drives available for
the Mac... Spectre GCR should work fine with them (at most, a patch
might be needed).

About a year ago, I went through the somewhat ardous task of buying and hooking up a muli-sync to my ST. There are 3 models I can name off the top of my head, and all are good monitors:
NEC 3D, Acer 7013, Loop CT1458
Both the NEC and the Acer are 800x600 norm and 1024x768 interlaced models, while the Loop is a 1024x768 NON_interlaced. All can be had for either $250-$400. And, yes, the monitor MUST support a 15.75 scan rate (why is that ridiculous?!) There are several multi-sync connectors on the market that will also switch modes for you - the most common are: Ominix-3, OmniSwitch, ToadSwitch, and the Ultra-Switch - I bought the Loop - good luck!

Ha! This is serious, isn't it? :)
Yes, there are tons of programs that do exactly this - and lots of them are
pd. two programs I have a lot of experience with are 'Superboot' and Xboot'.
Both do a very good job and I don't know which one I prefer.
Take a look at atri.archive.umich.edu - I'm sure they have the thing you're
looking for.

-=< MEETING ANNOUNCEMENT >=-

AUSTIN ATARI COMPUTER ENTHUSIASTS (AACE)

WHEN: Saturday, 12 Sep 92, 1400 - 1700

WHERE: Bethany United Methodist Church in Anderson Mill
(on Anderson Mill Road just southwest of US-183 intersection)
Bethel Building, Room 5

WHY: Presentation by Tim Gallivan

If you are an Atarian in the Austin area, you don't want to miss this one! Tim Gallivan, a Postdoctoral Fellow in theoretical physics at UT, will be giving us an opportunity to see an Atari ST do things many of us were unaware were even possible. Tim's machine started life as a 520STf, but now sports 4 MB and an AT case with DEC LK201 keyboard. The foreign case also houses his two floppies and 85 MB hard drive. Tim is responsible for porting Ghostscript, a PostScript language interpreter, to the ST platform, and for writing a GEM shell for it. In addition to Ghostscript, possible demonstrations include: MiNT, CS-TeX, and Unix Windows (only if we can rig access to a phone line). Y'all come!

As usual, we will also have available our ST and 8-bit libraries.

>(protonen@daimi.aau.dk)

Doing a 'ls' in the new-directory never shows you anything, although the new stuff *is* there (is that a 'permission'-thing?). But if you know that what you're looking for is there (as with STZIP20.LZH), you *are* able to 'get' the archive. So nothing's wrong and no patience needed.

2484. Revolution in ST/Mac/PC world

Newsgroup: comp.sys.atari.st
Date: 1992-09-10 23:28:39 UTC
From: hjv@phil.ruu.nl
Message-ID: <hjv.716167719@groucho.phil.ruu.nl>
Source record: 217847

You are not gonna believe this!
Just this night, after years of careful research, I have been able to interbreed the species Motorola 68040 with an Intel 80486, so talking to you right now is the proud 'father' and owner of the first Mintella 6804086 chip!!!
The first weighing and health-checking has given me a first impression of what this newborn chip will be able to accomplish (all very preliminary - minimum ratings):
clock upto 64 Ghz,
RAM upto 512,000 Gbyte
built in 256-ch DSP, samp.rate upto 16Mhz
True-true color: 16million^16million colors
Max. resolution: 7631876378000 x 5678318394000 pixels
256,000 native instructions
78421200 MIPS

Watch the news folks and stay tuned, soon you'll be hearing more on the subject.

So now it's (at last!!!) completely evident which computer to buy: since the stock-price for this new chip is sure to be <$20 and hardly any additional hardware is necessary to control the chip, HJV inc. will -one! month from now- release the soon-to-be-famous H/M 6804086/64G computer -and the guaranteed price will be -hold on, here it comes- ONLY $120!!!!!!!!!!!!!!!!!!!!!!!!!!

So maybe all 'grown-ups' reading this group can *NOW* stop their childish quarreling about which computer is best and which sells best and which has the best software platform and which has the nicest casing and which f***s or s***s best, because *NOW* you'll *ALL* be able to sell your dinky-toys and buy a *REAL COMPUTER* for the price of a cheap CD-player.

And besides, it *does* get rather boring, all these threads full of people yelling to each other. Reminds me of the days we kids were quarreling about 'my daddy's car is bigger than your daddy's...
Please, reading this buls**t costs me -and many others- far too much time, it wastes tons of bandwidth, and it is very, very tiresome.
Could we please use this group for exchange of information and for -sensibly- discussing ST-related subjects? Please.

Hendrik Jan

P.S I know *I*'m wasting bandwidth also. OK, Since I already know, don't flame me. Flames will be sent to the eternal bit-nirvana.

Actually, it
depends on your definition of accuracy. If you use a sampling frequency
twice that of the sine wave's frequency, it would end up as a triangle wave.
At three times the frequency, you would get a square wave. Therefore, to
retain the shape of the sine wave, you would need a frequency of at least 5
times that of the sound itself.

Not so!!! AT-Speed C16 (an internal IBM emulator) is running inside my
MegaST 4 at 12.9 Mhz. There are speed test one can run to find oute
exactly how fact their system is running. There is also a 386
emulator available for the ST. Since AT-Speed C16 is a 286 emulator I
would expect the 386 emulator (also made by the people who make AT-Speed)
runs even faster.

Have you taken a look at SuperBoot? It's an autoboot program which lets
you decide which files in you AUTO folder and which accessories will
load at boot time. You can have up to 10 different configurations. It's
PD and should be in just about every library.

2490. Atari users group meeting

Message-ID: <10SEP199223435331@opal.mgh.harvard.edu>
Source record: 217724

Hi, I am interested in getting a color Multisync monitor, i.e.
so that I can view all resolutions i.e. monochrome (high)
and medium and low color on the same monitor.
And it should have an autoswitching powersupply that
can handle it when I move back to Europe, and since it
s a multisync, it's probably VGA compatible as well.
Please reply by email, if you have any experience with such monitors,
or know how one could hook up a VGA monitor, such that
it works properly with an ATARI ST
Thanks

>"student" version would be made available for existing machines.

Feel free to interpret how you like what a Director of Communications
says. Also feel free to discuss with the folks who lost their jobs
whether or not they were actually "laid off". Yes, a "production
release" was done shortly before the layoffs (or whatever you feel
like calling them). Since when does that make a project "done"?
Ever heard of maintenance and support? (For that matter, ever heard
of a UNIX release that worked right first time? But that's another
matter).

Oh, really? Yuck. I tried installing that and ran the DOSTESTR
program which creates and deletes a bunch of files and screwed up a few
directories badly. I thought it was the test program, which crashed.

I didn't notice the promised tremendous speed gain, but...who
knows. It certainly won't compete with MiNT.

Mark Kovarski (kovarski@zooid.guild.org) wrote:
: You can configure ANYTHING in OS/2 2.0, including what you want to install.
: My swap file doesn't exceed 2 MB. You must be joking when saying, "it feels
: like a 8 mhz ST." Have you really tried it. I see NO speed decreases in OS/2
: at all. As a matter of fact, I am running it on a 486/50 MHz DX with 16MB
: RAM and ATI Graphics Ultra. It is as fast as a TT with NVDI loaded in.

You take a 50MHz 486, give it 16MB of RAM to play with, add one of the fastest
(and most expensive) graphic boards and it's only as fast as a TT with a
software screen accelerator?!?!
As you can get the same performance out of a system that costs less than
half of what you paid, I can understand you are so upset...

: The screen redraw functions are immediately displayed with no delay at all. On
: slower machines it might be the case but not on mine. Also, it accesses the HD

You should see it on a more "average" 386/33 with 4Megs sometime. It's slower
than an 8MHz ST and that's on a machine with four times as much RAM and
supposedly four times as fast.

: TOS assumed there would never be a drive B:

No, it's not a software-problem. The only reason is that there isn't enough
room for another port.
I don't think I will miss the second floppy port very much. If you want to
do some serious work you'll need a harddisk anyway and if you just want a
Falcon for fun and games (and I hope there will be games for it) then those
will support only one drive and/or a harddisk.

Maybe it is.

I don't see any use at all for a second floppy drive. I hardly use the
internal one I have now. I never even bothered to up my tiny 360K SS
ST floppy to a 720K DS drive until after I'd had 2 hard drives.

Floppies are just for transfering data between computers. What use is two?
Especially when the one you have holds 1.4M anyway.

Sure, anyone who doesn't have a hard drive probably thinks two floppies
is absolutely essential, but what does even a SMALL hard-drive cost these
days (especially when you already have the IDE and SCSI connections ready
to be used)?

2500. Any suggestions for term.progs that can handle dial-back modems

Newsgroup: comp.sys.atari.st
Date: 1992-09-11 06:48:29 UTC
From: cpr@dde.dk
Message-ID: <1992Sep11.064829.28799@dde.dk>
Source record: 217739

I am looking for a terminal emulation program which can handle calls
to (or rather from) dial back modems.

I've been using Uniterm so far, and I'm quite happy with it. Unfortunately
it doesn't seem to be working with dial back modems. It does not pick up
the phone when the hosts dial back.

Maybe I am doing something wrong, in any case I would like any
pointers to how I solve the problems or what program to use instead.

thanks

2502. nroff 1.2.1 uploaded

Newsgroup: comp.sys.atari.st
Date: 1992-09-11 08:21:18 UTC
From: rosenkra@convex.com
Message-ID: <1992Sep11.082118.17920@convex.com>
Source record: 217710

as promised, i have uploaded file "nroff121b.zoo" to atari.archive
(in atari/new dir).

this contains binary only distribution of what i am currently using:

nroff.ttp v1.2.1
man.ttp v3.0.1
manpager.ttp v1.44

included are manpages (source+formatted) and -man and -ms macros for nroff.
see readme for install/use notes. i'll post src later. this nroff will
(correctly, i hope) generate font escapes for manpager (use -T option).
i have used these heavily over the last couple of months (eg formatted 200+
manpages).

still missing from nroff are traps/diversions/etc. i may never get to this!

enjoy...

This maybe true or it maybe a rumour based around the fact that Macs with
HD disk drives can r/w DOS disks with suitable software. As far as I'm
aware, Atari's Ajax FDC is just a 1772 that can be clocked higher. Is there
anyone able to confirm or deny this?

All development *done*? Man, are you kidding?
A product like this is never finished.
I saw the latest release (I hope it was) at Atari fair, and the
mouse driver was as damned as before, you could hang up the system
for some ten seconds by simply moving the mouse from one window
to another while the computer was busily counting numbers in a
shell script...
Furthermore, it still comes along with GCC 1.39 - these days most
people use 2.2.2. OK, you can compile it yourself, but I think
it reflects what the guys from Atari think about updating.

Regards, Markus.

|> code should not be too tough.
|>
|> For this to work, the DSP would have to have full speed access to main
|> memory; anyone know if this is so?
|>
|> Erik Johnson erik@microware.com

No, it hasn't, for good (physical) reasons :

- DSP adresses 64k Words (of 24 Bits), within
3 (possibly) distinct Adress spaces X,Y,PGM

- "full speed access" means no_waitstates, no_shared_memory
that's why the DSP has it's own FAST static RAM.

You would need rather a lot of GLUE logic to make '030 and DSP share a common bus.
i.e. Adress translation, Format conversion, bus arbitration,....
And what for? the main bus is already crammed with the CPU, the Video System
(incl. DRAM-refresh), optional '386 board, DMA access for HD,SCSI,Sound...

But then, how IS the DSP linked to the rest of the system ?

- the HOST interface : 8-Bit wide, with Handshake bits
XBIOS calls provide interrupt driven block read (and/or) write
operations, with or without blocking the calling process.

- the SSI (synchronous serial interface) channeled through the sound system,
whose DMA facilities should work for pixel data as well as for sounds.

That way, DSP usage for Graphics should be similar to "normal" DSP usage :

```
+------------------------------+
| DSP Program in harware loop |
+------------------------------+
DATA IN ---->| arbitrary transformations |----> DATA OUT
+------------------------------+
| DSP data (coefficients) |
+------------------------------+
```

Data is fed through the DSP, which performs repeated online transformations.

For example :

- Viewing transformation :
DSP setup : viewing matrix, viewing direction
DATA in : 3D-Vectors (Object Coordinates)
DATA out : 3D-Vectors (World Coo.)
perhaps with flags for backfacing vectors.

- Line by line Shading
DSP setup : lighting model, lamps, material properties...
DATA in : pre-sorted surfaces (triangles, meshes, perhaps NURBS)
DATA out : pixel values

- Ray tracing
- Simulation (particle simulation ... flight simulation)

And now for something completely different :

The external SSI connection would allow a pipeline of !external! DSP boards.
There are special chips for audio filtering used like this. (no complete DSP
but just dedicated filtering stages).

I'm not sure such an external pipeline would be worth its cost, but

- the 56001 supports such small systems (internal RAM, bootstrap modes etc.)

- While DSP's and fast SRAM aren't right now sold in sixpacks, with the growing
DSP usage in telecommunications and consumer electronics, who knows ?

I am sure a lot of people will answer this one; so I will put in a quick vote
for Superboot (v7.4, if I remember rightly),, before such mentions become
depasse.
I have it running on both TT's and ST's - very solid.
Incidentally, on my TT, I cannot make it autorun GEM programs - is this me,
or are other people having the same problem?

>: P.S. I think honesty is a virtue.

>Okay - so what you're actually saying is, you would prefer to buy a computer
>that is advertised as the fastest,

[... deleted some stuff]

> :-)

I didn't say I would prefer to buy such a computer, but I think you sell thing
to a lot of people that way. Of Course there are such persons (as you and
me perhaps), who know about the features of the Falcon and who can't be treated
that way, but there are persons, who don't know and who hear and _believe_
the lies other companies than atari spreed. What will those people do??
Well what would you do? Of course you would buy the "better" computer just
to see, that it doesn't do what it should do when you really use it (e.g.
making coffee).

>[...] I don't think that
>Atari would have gained anything by putting liars on the stand. Apart from
>the obvious reason that this is definitely not the way to go, [...]

I AGREE with you: This is not the way to go.
(remember: honesty is a virtue)
But from point of view it's the way to sell something if
you aren't the only one who sells.

In MY eyes (so please don't start a flame war) Microsoft Windows 3.0 is a big
piece of shit. (Microsoft Windows 3.1 is an even smaller one). And how do they
sell it?? With a lot of advertisment with (a few) lies. That's the way it
goes today (even if it's not the way to go).
Windows is even sold, while there is OS2/2.0 which is obviously the better
solution. But IBM is to honest about it, and so is ATARI.

> [...] it would
>have been the wrong place anyway because a) most people on the show are far
>to competent to be fooled in such a way; b) the Falcons were there for
>everyone to see and everybody could test their software on them so any
>unbelievable claims could have been checked right away; [..]

Okay, Okay, your absolutly right with this !!!!
Maybe it would have been the wrong place to lie obviously, but as you said
most (so not all) were far to competent to be fooled, but not all, and
those were ther persons I adressed. Maybe I exagerate to much, to get my
point clear.

> [...]c) you can't sell
>a computer by just telling people: it can do this and this and that too
>without having some demo to back you up.

Perhaps you can't sell them right now, but when someone just hears it and
leaves the flair he will keep that lie in mind and the Falcon will have
better chances to get bought.
So actually you can sell computer that way (it's cruel, but it's true).

>Re: PS: Arguing that Atari should have lied at the show then saying that you
>think honesty is a virtue is not a good way to prove your point... what *is*
>your point!?!

I do really think (and i hope I act like it) that honesty is a virtue.
On the other hand the Falcon is very nice computer and it would be a pitty
if they don't sell them, just because they are _too_ honest.

Made my point clear ??

Oliver

If you are one of the thousands that have an external floppy disk drive,
you'd love to hook it up to the Falcon.

Tough, I bet it knocked about $50 or more off of the Falcon...

The only thing I just can't abide is that one-piece 1040 case (I'm currently
a Mega 2 guy). If I'm happy with the MIDI software I see for the Falcon,
I'll likely buy one and stick it into a tower case.

> and who knows, you may find the 16MHz 030 quite sufficient - after all
> you've gotten along fine with a machine with one quarter of the abilities

This is the thing to remember. Even a 16MHz 030 is a real powerhouse. The
world's finest MIDI sequencing software, Notator 3.1, runs superbly on an
8MHz 68000. Even when you add digital audio recording, I can't imagine
16MHz 030 having any trouble with these kinds of applications at all.

> I've already bought my hard-disk for the Falcon (okay, so I lose a bit

Luckily, I already have a 44Meg removeable SCSI drive, so I think I'm set
for basic operation. Now all I'll need is a nice 1-Gig drive, and I'll be in
business for some serious audio recording/editing.

2515. Mono software on a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1992-09-11 16:10:56 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Sep11.161056.21155@a.cs.okstate.edu>
Source record: 217734

Just out of curiosity...
I found hi-rez mode essential for stuff like {uw, mgr, uniterm(tek mode),etc.},
and since the Falcon's "true color" mode is of the same order... I'm inclined
to call it high resolution (from a many year atari user, just now experiencing
800x600 on a PC).
Can one run UW on a Falcon with a color monitor? Must it be a VGA monitor?(Do
I still need my monitor master and mono????)

Many of them: Desk Manager 3.3, Superboot 7.x, Xboot, Mouse boot, and
others. These all will let you select which ACC's and AUTO programs will
load up depending on which ones you want. A couple will also let you
choose such things as which DESKTOP.INF/NEWDISK.INF will be used,
which GDOS ASSIGN.SYS files, etc. You should be able to find most if not
all of these at atari.archive.umich.edu or some BBS's...

>Plus have had a Atari since 1986, and what I state is fact and not fiction...

I know from personal experience that zoo201.ttp allows redirection of output to a file (as in zoo -list ZOOFILE > LOGFILE) and creates directories as needed (as in zoo -restore ZOOFILE). It seems we have gone over this ground before, with a great deal of heat and little light.

Please give us exactly ONE name of a widely available zoo file which does not unpack the way you want it to. Please say what kind of output redirection you want to do (if it isn't UNIX-oid > or | redirection, an example of lharc commands which did what you mean would be helpful). If your example doesn't create directories properly with "zoo -restore" or "zoo e//" that would be helpful in explaining your complaint.

This is a request for one or at most two examples. Please be helpful by giving exactly that.
Steve

Although your idea of "retaining the shape of the sine wave" is
intuitively appealing, the Sampling Theorem (tm) assures us that
a sine wave can be completely represented even when sampled at
"only" twice its frequency. To understand why, you must realize
that a triangle wave of a given frequency contains components
of much higher frequencies. If the analog signal has been properly
sampled, then even though the digital samples may _look_ like a
triangle wave, the only "legal" underlying analog signal is
a sine wave.

Does anyone have a reference to the [British?] research that
supposedly demonstrates that the ear can detect "nuances" in
sound up to 35kHz? Or any research that demonstrates that the
conventionally-accepted human hearing range (~20Hz to ~20kHz)
needs to be reconsidered?
How about the idea that signals must be sampled at _three_ times
their highest frequency?

There are a lot of boot-selectors. The most common is SuperBoot, but I
prefer ST_MBOOT (mono only).
SuperBoot is avaible at atari.archive. /atari/utilities/spbt_7_2.lzh
I will upload STMBOOT soon...

There's a strong case to be made for availability of service and peripherals. If you have a PC or Mac, you can go almost anywhere to get service or buy software/parts off the shelf. So far, the best bets for Atari service have usually been music stores, whose software tends to be restricted to the realm of MIDI. I don't consider this a problem, but it sure is for a lot of people, who must use mail order to get stuff.

I think that a lot of us Atari folks buy computers for a specific purpose and are willing to suffer the inconvenience. I certainly feel that way. There could be 100 Ford dealerships in my town, but I'd still rather drive a Mercedes.

There MIGHT be some problems for novice users to set-up a PC right but
usually its very easy. At least I can put 64 Meg on my motherboard how about
the Falcon030? 14 Meg and that's it. What do you do if you run out? Wait until
Atari releases a new computer that will be able to fit 15 Meg? I agree, it
might be a little bit expensive but the advantages are enormous. BTW,
every body seems to talk about the Falcon. Can you tell me where I can buy i
NOW? Ohhh, how much are those memory upgrade modules? I hear everything WILL
BE available but where is it? Where are all the "ports"?

Let's get real, who are we bulls******.....

>machine for under xxx$, but you'll have to spend about the price of
>the machine itself for a wordprocessor. Stupid. Unless of course, you
>do as many (almost all) PC users and get yourself an illegal copy.)

You want Borland, which is basically a PC based company, but you don't
want any others? You want ST software that will be able to import/export
WP and Lotus files but you have PC compatible computers? Why do you need
such a function if you hate PC computer so much?
If you believe that WP is the same as First Word Plus you must have a
serious problem. Why isn't Atari software review in major publications
such as Byte, PC Magazine, and so on? They review Mac software as well but
NEVER-EVER Atari software. Even DTP, nothing in that cathegory. Do I have
have to spend thousands of dollars on a word processor package? No. Do I
have to spend a few hundred dollars? Maybe. Will I spend it? I did and
will continue to do so since a good package deserves the support. Do you
know what it comes down to? Being CHEAP! That's exactly what killed Atari
support and major developers such as Borland will not support Atari any
longer. If you want a good package for the Atari you have to spend a few
hundred dollars anyways (Calamus, Notator, CuBase, and many more).

>
>A bit of a hasy posting, and I'll probably get flamed for it. But I'll

I have also the Atari and _I_ know if the 486/50 is faster. I have seen the TT
running and to be honest, didn't impress me AT ALL (otherwise I would have
bought it). BTW, try downloading on a TT at 14.4 on two comm ports and see if
you get 1680-1695 CPS rates on both. At the same time though get a WP to
reformat a doc and then drag/copy/move files around. All at the same time.
Try to keep all windows open so you can see how it progresses. Let me know.

You can use MiNT to do it since MultiTOS is not available. Hope to hear from
you soon...

Regards,
Mark K.

Are you sure you don't mean canine ear? The human ear at best hears up
to 20KHz, and the typical adult hearing range is up to about 14KHz.
Besides, to reproduce a 35KHz waveform from samples all you really need
is a 70KHz sampling rate. Hell, CD's are sampled around 44KHz!

Wow! I'm afraid you've got this backwards. A sine wave has a single
frequency, where square waves and triangle waves may be constructed by
infinite sum of sine waves of *higher* frequencies. This is called a
Fourier series. A sine wave can be completely described by a single
frequency component.

>R.M. Selby

I use the commercial software XBOOT. There you can select and sort your
programs in the AUTO folder and your accessories. You can save many
settings and can switch a default set. You can choose three types of
INF-files (e.g. DESKTOP.INF, NEWDESK.INF, ASSIGN.SYS, RAMDISK.INF) and
select the Blitter on or off.
I think the actual Version is 2.57.

Maybe there is a PD doing the same, but i don't remember the name...

Actually, I'd suggest HAZEL. It has a few warts, but it has GFA source
code included, and it allows selection of desktop.inf and assign.sys
files, as well as auto folder programs and desk accs. And nicest of all,
it only activates if you hold down left-shift while booting. Otherwise
it assumes your setup is fine as-is.

Of course, you'll still need Headstart if you want to autorun a program
but that's all right - I prefer several smaller programs to one big one.

>
>jc
>

If you have a VGA monitor for the Falcon (you know, the one that plugs right into the port on the back :) then you can use ALL of the Falcon's display modes on the same monitor. This includes the 320x240, 320x480,640x240, 640x480, whatever all those modes are (I think there are like 16 modes or something). In addition, you can do all the normal ST modes (320x200, 640x200, 640x400) with no problems whatsoever. So, yes you can run both monochrome and color ST/STe software on a Falcon with one monitor (if it's a VGA monitor).

Also, if you have such a VGA monitor, you'll get all the hi-res modes (like 640x480) non-interlaced -- if you have a TV or SC1224/SC1435/whatever, you'll get those modes interlaced. However, I think with a VGA monitor you lose one of the true-color modes because common VGA monitors can't handle the bandwidth or some such thing (please don't ask me to expand, I'm just repeating what I heard before... :-)

Good luck!

Just note that the original information was about SOFTWARE
emulators !
In order for them to run at 8Mhz 286 they can't be just interpreters
but real '286-assembler'-compilers (as will be the Mac-on-a-PowerPC
emulator). And even in this case, getting the same kind of speed as
the one of the 68000 8Mhz (that is *mz 286) is almost impossible !

Of course, using an other processor permits to go much faster
(and much easier) !

>

I'm planning to buy the Falcon 030 w/4 megs and 65 meg h.d. in
Spring of next year.

Oh, the reason I'm buying a Falcon 030 with 4 megs is because I've
been told over and over by my friends that 2 megs is needed for
VGA games.

I do all kinds of things with my computer and 4 megs would
cover everything.

I wish that $1399 was more like $1199, but don't we all?

By that time, all the bugs will be worked out and Multi-TOS will
have many programs taking advantage of it.

SPRING is it for me guys...

You CAN !
That's all !
It's the same 'hardware' format !
Just the logical format (FAT, directory, ...) is different !

It isn't GCR anymore: it's just good old plain MFM !

I've been able to read a MAC 1.4MB disk on an st with 16Mhz
clocked 1772 ! (it was just for fun: I have no Mac emulator)

Well, if it came to a choice between the SCSI 2 port, and the floppy
port, I think most would agree that the SCSI 2 port was the way to go. We
are after all talking about a machine with not a tremendous amount of room
back there.
The SCSI 2 port should more than make up for any 'tears' shed by not
having a external floppy port. So many folks are getting upset about
having a port that is becoming less and less a standard (the 720K Atari
floppy) when what thay are getting is a port than can handle a new 1.44, 2.88,
floptical, and hard drives to boot. And all STANDARDLY available! I think
its really a small price to pay. (I highly expect Dave Small will have
a fix to get a GCR working with the Falcons).

>is like having no floppy drive on the STBook... just one more way to
>drive good customers away.
>

I'm not sure how Spectre GCR works. Why is the external drive needed?

Can't it use the internal drive?

Also, can't Dave write some kind of fix for it?

I wonder if Atari contacted Dave Small about the external drive port...

They seem to be putting him out of business... First is was the
Mega ST expansion port, then there is the Falcon with the increased
speed that a lot of people will no doubt purchase instead of his SST,
and now there is no floppy port for his Spectre...

Of course, Atari can't change the Falcon now even if they wanted to.
It would cost too much. Besides, as someone said before, where could
they put it?

The only place I see is between the headphone and microphone jacks
and even that would be a tight fit. Maybe they could put the
headphone and microphone jacks on top of each other?

This would give them enough room. I'm not sure how much it will
be used, but all PCs today seem to allow for another floppy besides
the hard drive.

I guess I'll have to agree. We all cried about not having CD-ROMs
available for our computer.

The SCSI 2 port should help a lot there.

I thought about how the Falcon 030 and Jaguar could possibly
be compatible with each other.

We hear that the Jaguar may have two 68030 processors running in
parallel. Well, what happens if you stick another 68030 in that
empty processor slot?

And, I bet the Jaguar wilhave a CD player built in...

What happens if you just add a CD player to that SCSI port in the back?

I'll bet that the Falcon 030 and future Jaguar are very closely
related and I'll that both were worked on the same time...

Now, you must be really ignorant as to what the Falcon 030 was built for.

It was designed as a home computer. It was not designed to compete
with the big boys...

Though, it can probably do so... I have no idea what you would need
64 megs for in home computing!!! Give me a break...

Maybe after you hook up the Sound blaster and all of these other
cards to a PC, you'll need that much memory, but I'll doubt you'll
ever need it on the Falcon 030.

And let's see, you may need it to run Windows, but I'll doubt you'll
need it to run S 4.0.

Let's face it, IBM compatibles are having growing pains and you are
paying for the medical bills! :)

>support and major developers such as Borland will not support Atari any
>longer. If you want a good package for the Atari you have to spend a few
>hundred dollars anyways (Calamus, Notator, CuBase, and many more).

Well, if being cheap means that I will be dishing out a few hundred
dollars less for word processors, databases, DTP software, etc.
than you, I like what cheap is all about!

The funny thing is, it is pretty much the same thing.

And don't even mention Word Perfect, the software is still full of
bugs. I find them all the time and the copany can't explain the
problems...

>
>I know the truth hurts but life is though...

This is the difference between people that own Atari's and people
who own PC compatibles: Atari users know all about marketing because
they talk about what Atari needs to do. They know what going

after niche markets is. They know what it means to OWN affordable,
yet powerful software.

You know, I've learned a lot owning an Atari computer!

This is all bullshit. What such people need (among other things) is
to get an audiogram. First things first: what one can and cannot hear.
Test self before posting. Or writing in a magazine.

I also tried this program. I did notice a great speed improvement, but I also found that the call to set the date was not spectacularly compatible. A date-setting program (that uses completely legal, straight-forward calls) simply would not work after installing PowerDos. Now that I hear about the problems with trashed partitions, I'm not exactly eager to use the program again. The program had great promise as a speed-improvement for GEM, though. As for the MultiTasking, it didn't seem like much of an improvement over the regular way things are.

2546. How to 'become' an atari devleoper?

Newsgroup: comp.sys.atari.st

What is needed to become a developer for Atari machines?
I am not really "anyone" (no business...soon though) so i didn't
want to get laughed at if i'd acutally call atari.

Is that the correct approach? just call them first?

i assume paperwork would follow, and various "large" developer fees?

what did all you developers go through?

(atari is an hour away from my house... so thats not a problem...)

Timothy.

=======================
Having used a Hybrid Arts (R.I.P.) ADAP sampler, I can tell you that the
accepted minimum requirement is to sample at 2x the max. freq. you want
to reproduce/record. If you are baffled, look up the Nyquist Theorem;
CD's sample at 44.1k and DAT at 48kHz for this reason also.

2549. Re: Is Falcon worth buying?

Newsgroup: comp.sys.atari.st
Date: 1992-09-12 09:41:41 UTC
From: leonp@cs.kun.nl
Message-ID: <1992Sep12.094141.18101@sci.kun.nl>
Source record: 217764

Well, just a couple of thoughts.
I want to buy a new computer within a year (I now own a 1040 and I'm happy
with it and I wont sell it) and I'm making a few considerations now:
- I want to have multitasking. Why? Simple because it permits me to
edit a text, and still run my favourite terminal emulator and gcc
in the background. This is great for downloading and such. Moreover it is
nice to have multitasking in that you can have several applications active
(not necessarily running), so you can switch easily: just click its
window.
- I need lots of memory (at least 4meg for an atari and 6 meg for a pc).
This is neede for multitasking, latex, c++ etc.
- I want a windowing system. I just like them and it makes me much
more productive. It also makes multitasking sensible. This window
system needs to be easy to program, that is I want easy access to developer
software etc. Good looks for the system is also nice. For all this
I need high resolution (800*600 or in that range) and maybe colour.
- I need raw horse power for doing neat things, like latex, dtp, maybe
image processing.

The possibilities are:
- Buying a MAC II or LCII. A great os (I DO like System 7). Great
software support and network support (though I don't need that), but
expensive, hard to program (really) and limited multitasking, though
multifinder is really neat.
- Buying a 386DX/33 PC with 6 or 8 Mb, VGA and a BIG HD. This would
need to run MS-WINDOW 3.x (Yuck!), OS2/2.0 or linux/X-Windows/OpenLook.
I hate messy-windows, because it is slow, crashes and consumes to much
hd space in comparison with what it offers. OS2/2.0 seems nice, stable
fast, modern, but it needs lots of Mb (internal and external).
Linux however is a unix clone (I like unix), its free, it can run X-Windows
and maybe I can get it to run the OpenLook user interface and apps.
Linux with X consumes lots of hd space however.
- Buying a falcon with 4 meg and a 65 meg hd and a vga monitor.
This looks great. With MultiTos it certainly offers what I'm looking for and
a lot of nice extras and its not to expensive. Memory can still be
expanded and I already have lots of software (partially self-made) that
can be used on the falcon. However: it cannot and will never run
unix (at least not for free) with X-Windows/OpenLook and I am not
very confident in Atari at the moment. They might just make it, because]
the falcon is a winning machine and a great MULTI-MEDIA machine, but
they have to invest in advertisement and software for it.

So, I don't know yet. All have certain advantages and disadvantages.
Falcon really looks the best choice at the moment, but I'll have
to wait for atari really getting things going. If not I might just

be forced to buy myself a cheap and fast and memory spending PC with
linux, allthough I hate pcs more than I hate rainy days.

Well, just my 2 cents worth....
Bye, leon.

>Wow! 5x! Wait until Nyquist finds out :-)

I doubt he will, as he's dead. ;-) However, he's probably rolling
over in his grave. At least twice as fast as this bs gets spouted, in
order to get a good sample.

Please people, if you want to find out some truths about sampling,
try the .audio groups, or comp.dsp. You'll defianately get more out of
it.

>the shelves, while Atari products gather dust.

Wow, that's incredible. You know, I didn't know that. In fact, I'm going
to trash my current machine and run out and buy a Classic II, just because
everyone else is too. I hadn't realized just how important it was that
so many people were buying lowly Mac LCs and Classic IIs. Oh, btw, could
you tell us again why you don't own an LC or a Classic?

>> An analyst such as you shouldn't have any problem adding up the
>> few extras included in the Falcon.
[... long, long, list :) ...]

>Perhaps, you're average computer buyer doesn't want/need these
>features or is unwilling to buy into a company with a shady
>track record to get them?

You're right, I don't want/need those features. I spend most of my time
in front of a vt100 emulator, I certainly don't want graphics or sound, I
wouldn't know what to do with them. :) It's also true that I'd prefer to
buy machines from a company which sues the rest of the industry regularly,
or from one which never seems to keep up with the hardware abilities of the
clone makers, rather than one with a shady track record.

>Besides, you can buy a 486-box with all of the features you
>describe except the DSP (I don't know much about DSP...sorry)

(you can get DSP on an 80x86 box too, at a price)

>running OS/2 (pre-emptive multitasking) for less than US$2000.
>And you won't have to worry about where you'll find software
>for your machine, or video boards, or sound cards, or...you
>get the picture.

Hmm, have you ever used OS/2, Chris? Know anybody who does? Know any amazing software written for it? (Other than WordPerfect, that is. :) Let us also consider that on the Falcon, you get DSP, pre-emptive multitasking, software, video, and sound for less than US$1000. Funny how that looks against your 486-box.

>What am I driving at? The Falcon may or may not be a good
>machine for the money, but you can buy comparable hardware
>from other more reliable manufacturers with better support
>track records, and a large installed base of software for
>roughly the same amount of money. Whether that other pc
>is of the Intel flavor or Motorola flavor depends on the
>whims of the buyer.

Hmm, at first I thought you were giving a comparison between the Classic II and the Falcon. But, let's forget that.

Fact: the falcon is aimed at a specific niche in the market (the low-end hardware/games people, if such still exist).
Fact: the falcon, at the rumored prices (I still believe the cost will rise), costs less than most of the more general-purpose pcs when given similar hardware.
Fact: people who desire a higher level of support, speed, or software base will NOT want this machine.

For people who fall into the fact 3 category, your above thesis applies. However, for those who don't, your above thesis is incorrect. You will find, I believe, that further arguments between Atari fans and your Big-Name-Brand-Is-Better belief will be relatively pointless, since most of us don't care about fact 3. (This is, of course, my opinion.)

Thanks

John

Accessorily, a lot of (at least some) DAT-readers can be switched between
48, 44.1 and a third speed (I can't remember).

I don't know if digital copy is easy to get (I believe there is another
protection). My knowledge in this domain is a bit too limited !
(and I don't have neither a CD nor a DAT)

I personnally tried such a defragmenter on my HD after
1 year of use. I didn't notice any speed difference !

I think that most of the files you have don't move that much
(applications, libraries, ...). So that defragmenting a HD
is only useful once in a while (if it ever is !)

2554. PAULA 2.0 for STe/TT, not ST

Newsgroup: comp.sys.atari.st
Date: 1992-09-12 14:44:03 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1686088E3.C556212@mizzou1.missouri.edu>
Source record: 217767

Don't get your hopes up about Paula 2.0. It sounds like a cool program,
but after printing out the documents, I realized it's for Ste/TT owners only.
Somethings that sound too good to be true sometimes are. :(
Anything out there for a lowly ST user like myself that is in the same
genre? I tried mplay1_2.lzh, but it slows down all my MODS. The only way
to make them speed up is to go in and edit each one to adjust the speed.
What a drag! I also tried cdplayer.lzh (both from Atari.archive), but I
couldn't get it to run. Anyone else with a similar problem?
Any more suggestions? Maybe I should get a bigger CD collection,
but that isn't as fun....

J.H c556212@MIZZOU1.missouri.edu

To be precise, the sampling frequency must be a tiny bit more than twice.
Otherwice you can't tell the amplitude of the sine wave.

Most MOD players are made exclusively for STe/TT because they have DMA
stereo sound. Solution? Get an STe! It's worth it! :)

This is incorrect. If the sampling frequency is above twice the highest
frequency, all the information is there to accurately reconstruct the
original signal. However, to implement this you need a good low pass
filter. Badly designed low pass filters may introduce phase distortions.
Good filters are expensive. But if you have a DSP you can do oversampling
which simplifies the needed filter. So buy a Falcon!!!

> unix (at least not for free) with X-Windows/OpenLook

Actually, there's no reason at all that a Falcon couldn't run BSD 4.4 or
the GNU Hurd, when those become available. All the GNU tools (make, gcc,
gas, bison, flex, bash) are available now for the ST, and will run
on the Falcon, so porting the GNU kernel or BSD should be (relatively)
straightforward.

For that matter, I'm sure that X-Windows could be made to run under
MiNT/MultiTOS, and I would not be surprised if MultiTOS were eventually
Posix compliant (please note the qualifiers: I'm not saying that MultiTOS
is or even *will be* Posix compliant, just that I think it *could become*
Posix compliant).

flames(ON);

Here we go again; comparing a keyboard computer, a toy (with some considerable professional potential though), a niche product to a industrial standard business machine, which because of low prices also are becoming a home computer (but still is designed for business use).
Complaints on too litle memory capacity on the falcon is plain stupid. Yes it is limited to 14MB, but taken the main target use for this machine, it's just right. But it is quite possible to upgrade with fast-ram, and then the limit is 4GB! No, it's not as easy as upgrading a PC, one have to by some third-party do-it-yourself expansion kit, but nevertheless possible for those who want.
Machines with same target-niche these days have 1MB standard, and can be upgraded (with standard solutions) to typicaly 2 or 4 MB!
And remember, on PC's most software, and the most common OS, is limited to the 'real huge' amount of 640K, leaving some 63Meg (the above mentioned figure, but could be anny XX MB) as ramdisk or disk-cache. TOS have never been realy limited on maximum RAM other than that of physically limitations on the processor. And for those who run applications needing real huge amounts of memory, ther's the TT which for which there now is 64MB RAM-boards available, and soon to be produced (have seen a woorking prototype) 256MB RAM-Boards.
No need for memory drivers, 'highloading', etc.
PC's and memory is NOT the right argument to use about the 'superiority' of PC's over ST/TT/Falcon030!! How many PC applications take advantage of more memory than 640K? Most (99.9%) ST applications take advantage of ALL installed (free) memory! Eh, wel, not quite right on the TT, because you have to choose between FAST (4MB - 64MB or even more) or SYSTEM RAM (2MB - 10MB) on older applications.

In case you didn't notice - I own a PC and an Atari computer. Just keep this in mind because it might help understand.

I know what the Falcon was built for. You know what for? To get Atari Corp. out of the recession and nothing else! You said it yourself, it wasn't designed to compete with "big toys" but for some strange reason people continue equating it to "big toys." Isn't that strange?

What does soundblaster have to do with memory consumption? Seriously, I doubt you have ever seen a PC otherwise you would have known. Besides, I do not own a sound blaster-pro card. I have the regular sound blaster card in my 286 and the PAS-16 in my 486. Do you need more than 8 Meg on the PC? No, depends on what you are doing but generally not. At least I can upgrade to 64 Meg but can you? You know, a few years ago they said 64 Kbytes was enough. I am currently considering a motherboard that contains a 486/50 MHz DX and the i860. I have a 486/50 MHz DX but I like "toys." -)

I do not run windows and never will. Also, I do not pay any medical bills!

Regards,
Mark K.

It is faster than the TT but it easily outperforms any TT. However, I can run software that will "blow away" any ST software. Give me anything that can compete with the following: OrCAD, AutoCAD, WP, and any 3D animation software.

I am in particular interested in OrCAD and as far as I know there isn't anything that is as powerful as that piece of software. It is $1500 and is pretty affordable since industrial software is in the $5000+ range. I am not upset, I love my PC and I doubt that any other computer can offer me this power and support for the same price.

What are you comparing, TOS with Windows? Get real.

By the way: most Unix boxes run with 16MB RAM.
They can be upgraded, but the use of Virtual Memory
makes it useless: the 16MB act like a cache and are generally
sufficient (unless you run it as a file-server or any other
demanding application, but it's really not Falcon's purpose)

If Unix can run normally on 16MB I think MultiTOS will
too ! (and I'm sure VM extensions will appear very soon)

```
"OPERATION: A.C.T. NOW"
=======================

Atari Community Together Now
----------------------------

Campaign Organizers:

Len Stys, J.J. Lehett
Mark Leair

Sponsored by:

The Cleveland Free-Net Atari SIG

September 12, 1992

INTRODUCTION
------------

"OPERATION: A.C.T. NOW" is a series of campaigns that will
help increase support for the Atari 8-Bit computers, ST/TT/Falcon
computers, the Portfolio palmtop computer, and the Lynx handheld
video game system.

Atari Corporation seems to be serious about the future...
If you would like to help increase support for Atari products,
you can by participate in these campaigns.

Who benefits? Everyone benfits. Atari users get more out
of their investment, developers sell more products, dealers sell
more products, publishers sell more magazines, and Atari
Corporation sells more products. If you are a shareholder, your
stock may go up in value.

There will be campaigns that focus on increasing suport for
the Atari ST/TT/Falcon and campaigns that focus on increasing
support for the 8-Bit Atari, Lynx, and Portfolio. The campaigns
that you participate in are entirely up to you.

These campaigns will hopefully result in a stronger Atari
Community.

If you don't wish to help Atari Corporation, participate in
these campaigns to help yourself. You will enjoy your Atari
products more by greater support!
```

Cost?

There is no cost to you in any way to participate in these campaigns. There is no registration fee and no donations are being accepted.

Members Key to Success

The number of people participating in these campaigns are extremely important. The news of these campaigns must be shared with every member of the Atari Community that you know. "OPERATION: A.C.T. NOW" should be publicized in Atari publications, at user group meetings, and at Atari dealerships. If you take action, we can make a difference. If you sit back and watch, we won't do anything.

+------------------+
| CAMPAIGN ONE |
+------------------+

The first campaign will be to compile two lists. One list will consist of things that we believe the company is doing right. Atari is doing great things and if you want to continue seeing the company doing these things, you have to let them know. The other list will consist of things that we believe the company can do better. The company will never know the problems that you see unless you tell them. We will send these lists to Atari Corporation's Board of Directors and ask that they consider our suggestions. Will Atari listen? There isn't a successful company around that doesn't listen--especially to their customers, developers, dealers, and publications.

What you need to do is write down everything that you see right with Atari and the things that you believe the company can improve. Include any past experiences that you have had with the company.

Here are a few examples:

RIGHT IMPROVE
Users
----- Great products, No easy memory
great price upgrade

Once took 4 months
to get my computer
replaced when sent
to Atari

Developers
---------- Good developers Took 3 months to
area on GEnie get a computer to

develop on

Great computers Atari was rude to
to develop on me when they first
showed me the Falcon

Dealers
------- Good dealer Shortage of products,
support even today

No new products

Lack of advertising

Publishers
---------- Atari advertises Slow to pay for ads
regularly

Does not give enough
new info to us

The comments made in these examples should not be taken as truth. They are simply examples. Also, your comments can be as long as you want. In fact, the longer and more detailed, the better.

If you wish to remain anonymous, you may send these lists in another envelope.

The goal of this campaign is to inform Atari of things that we believe can help improve the company's position in the computer marketplace.

All of the lists that are received will be compiled and then sent to Atari Corporation.

```
+------------------+
| CAMPAIGN TWO |
+------------------+
```

The second campaign is to concentrate on letting computer publications know that Atari is back.

The Falcon 030 will be announced at the Boston Computer Society meeting in a few weeks. We should let the media know that we would like for them to cover it. The amount of press the Falcon receives will most likely determine when the Falcon will be shipped to the United States and how many are shipped.

What you need to do is list names and addresses of publications that you wish to see cover the Falcon's release. These include magazines, newspapers, and televison news programs.

You should also lists computer publications that you wish to see support the Atari ST and Falcon computers.

This information should be sent along with the "OPERATION:
A.C.T. NOW" registration form.

Since the Boston Computer Society meeting is on September 23rd,
we are asking you to send us this information immediately. You may
ONLY send this information through E-MAIL if you are able to at:
"xx004@cleveland.Freenet.Edu". Please send any other information
through the U.S. mail.

OTHER CAMPAIGNS WILL BE ANNOUNCED
AT ANOTHER TIME

THESE INCLUDE:

8-BIT, LYNX, AND PORTFOLIO
CAMPAIGNS

The Cleveland Free-Net Atari SIG is the official site of
"OPERATION: A.C.T. NOW". If you wish to add any information or
discuss anything related to this campaign, a special section has
been created specifically for it.

The Atari SIG can be accessed by the phone number "216/368-3888"
at either 300, 1200, or 2400 baud. It can also be accessed by
users from around the nation or world for free by using "telnet" at
their college or business by the following Internet addresses:
freenet-in-{a,b,c}.cwru.edu = hela.ins.cwru.edu = 129.22.8.38
Type 'go atari' at any menu.

The Cleveland Free-Net Atari SIG's U.S. mailing address is:

Cleveland Free-Net Atari SIG
P.O. Box 364
Mentor, OH 44061-0364

The Cleveland Free-Net Atari SIG's Internet e-mail address is:

xx004@cleveland.Freenet.Edu

"OPERATION: A.C.T. NOW" is in no way affiliated with Atari Corporation.
These campaigns are organized by individuals that have an interest
in Atari products. The "Atari" name, logo, and any other Atari
products mentioned are copyrighted by Atari Corporation.

It's not only a good idea, but -IMO- it's absolutely necessary to defragment your hard disk every once in a while. It absolutely speeds up HD-access. I suppose it's not too hard to imagine that reading a file that is scatered in 10 pieces takes more time than reading the same file when it's stored in one contiguous block... :)
There are several programs that perform the trick, but they're not all able to defragment all kinds of HDs. For example: I have a 210Meg Quantum HD (lucky me :) and most defragmenters can't cope with this disk, due to 'non-standard-Atari' logical sectors (I think). They're 1k instead of 512 bytes and most programs get confused by this.
I use CHKDISK3 and ST_TOOLS and both are very useful for analyzing your HD, find lost and orphan clusters, recover deleted files, analyzing the FATs, etc.
I don't know if CHKDISK also defragments HDs, but I'm sure ST_TOOLS does.
I don't know where these programs can be found - try atari.archive. If you're desperate, mail me.

Hope this helps,
Hendrik Jan

>Drive once in a while?

I already wrote a follow-up to this article, but have forgotten one thing:
please do not defragment your HD twice a day - IMO that's ridiculous. It *is*
good -and even necessary (again IMO)- to defragment once in a while, but
twice a day...? I do it once every few months or so - whenever I notice a
considerable speed-decrease.
It's also a good idea to have a separate partition for data that changes a lot
(e.g. projects you're working on, stuff you've downloaded, etc.) and separate
partitions for 'stable' data (e.g. programs). The 'changeable' partition will
get fragmented the most whereas the 'stable' partitions won't get fragmented at
all (or hardly...) This way you need only defragment one partition - spares a
lot of effort, time and HD-access (esp. with a 210M hd it's very nice to not
have to defragment the entire disk).

that's it,
Hendrik Jan

IBM-users need de-fragmenters, as their Hard-Drive accessing is much slower than the ST's!

(Also, slow Hard-Drives benefit from de-fragmentation)

There is a program called 'Reorg' which probably comes with 'DL-II' this de-fragments floppies and Hard-drives.

The best one is 'Chk-Disk' which Atari in their infinite wisdom released only to developers! But, it is rarely available on *some* FTP sites! (I've seen it around)

Double Click Software is releasing a new Term program written by, of all people, Alan Page. Alan Page is the author of the original Flash. The program is do out December 7th at a price of $59.95.

If anyone has had the misfortune of trying Flash II they will be looking forward to this Program.

Storm:

Work on all versions of TOS
Has a Basic Script language
100% multi TOS compatable
Multitasking without Multitos...download and use the basic lang
or edit the capture buffer.
Macros
Background transfers in X,Y,Z modem and CS B+

It looks promiseing.

Slip.

> Then why do they also sample at 44.1? And if your conjecture was true,

This is -not- conjecture. This is the reason why we do not have DAT today, except for introductory high-priced offerings. The audio industry put a great deal of pressure on congress (whoever, I am not certain), and completely stopped the introduction of DAT to the US. The response of the manufacturers was to change the sampling rate to prevent direct digital copies. This is history, not conjecture. Your assertion is one of ignorance, not past events.

What has happened since then I have not followed. Here -I- am ignorant. But that does not change history.

I ran a BBS and have 135 megs worth of hard disk space. I remember once running a defragmenter on a drive that had about a thousand files which had been moved quite a few times. It sped it up quite a bit, but the everage user probably does not have that much to speed up. I also remember on one occasion crashing my boot C: drive with some lame PD defrag program. Just be careful on what you do because it screws with the FAT sectors...

Just tell your modem "S0=1" such as
ats0=1dt555-1212
to dial the BBS.... then when you get disconnected the modem will pick up on
the 1st ring.

Or... just type ATA at the modem when the phone rings...
(or type it after you see "NO CARRIER" and hit return after the phone rings)

Good luck!
jc

2584. Will ST's lose value once the falcon is released?

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 06:25:41 UTC
From: krakover@spot.Colorado.EDU
Message-ID: <1992Sep13.062541.2540@ucsu.Colorado.EDU>
Source record: 217653

I was hoping to get some opinions on weither people think that the ST's
and TT's used market value will decrease once the falcon is released.
It seems to me that someone buying a falcon doesn't need their old system
and that will lead to a flood of used ST's and TT's being advertised.
As I am in the market for a used Mega STE, I'm wondering if I should wait
until the falcon is released so that I can get a better deal.

Thanks,
Jonathan

Much as I loved Flash 1, I can't see where the features of Storm
offer any improvement's over STalker3. From the more extensive description
in ST Report, it seems that the background downloading is only workable
while in the program. What if you don't want to edit your capture buffer
or program in basic. At least with Stalker, as a DA, you can be down-
loading from any Gem based program. And now, thanks to a real rts/cts fix,
(serialfix1.1), even uploading at 19,200 doesn't screw up the way it used
to.
I get 1660cps regularly with Stalker in zmodem, in the background,
while reading news with Gus, or Editing in any Gem based text editor.
Even unarcing doesn't kill the download, unless you do it for long enough
to time out.

Usual disclaimer about my uninvolvment with Gribnif or Eric R goes
here.

============
<< I previously posted on this subject RE: Hybrid Arts ADAP >>

To clarify "a bit" for those unfamialr with DAT's and stuff:

The standard DAT sample rate is 48KHz, which offers somewhat trivial
improvement over the CD standard of 44.1kHz. However, by implementing
a copy restriction flag on commercial CD's, you are disallowed from mak
ing direct digital-to-digital copies without constraints even if you are
able to record at 44.1KHz. Of course, you cannot make direct digital
copies when the data rates don't match. (i.e. playback 44.1k, record at
48k).

HOWEVER, there is a reason for a DAT recorder to be able to record at
44.1kHz; That is so that if you are making a "Master" tape to be
transferred to CD media (For your first Gold album :)), the DAT stereo
master can be digitally transferred to CD without going thru the analog
A/D and D/A converters in the playback and recording decks.

Note that by using the analog inputs and outputs of a CD and DAT player,
there is no copy restriction since the DAT player is no longer receiving
digital data directly. 'Of course, then that means that you are not
making a digital copy...

A comment of the proposed DAT tax:
This was proposed so that blank tapes would have a tax excised that
would reimburse recording artist for the unavoidable bootleg copies made

of their works. Since DAT is likely to remain a semi-pro/hobbyist media, I don't see this tax having a major consumer impact. (The problem being that for semi-Pro use, you shouldn't have to pay tax since you aren't bootlegging...)

If you are wondering if DAT is worth it, a recent review of a top-of-the-line Nakamichi cassete deck showed it made better reproductions of a CD source than a DAT....showing that a high quality, properly calibrated cassette deck is still a viable medium.

True, if a port of unix is done then it surely will run great on a falcon,
but porting linux will take a lot of time and I don't know if the
user community for falcon is big enough to support such a development.
If it will be ported (together with X) on the other hand, it will be
a superb choice for me and other people looking for cheap unix
stattions, that can also run great atari st software.

2589. MOD players (again?! *:)*)

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 09:15:54 UTC
From: chan@pyramid.unr.edu
Message-ID: <4456@equinox.unr.edu>
Source record: 217672

Well, I've just tried CDPLAYER.PRG and I like it very much.
Features:
1) graphical presentation of MOD files played (LED displays)
2) STE compatible (stereo/4 channel/2 left/2 right)
3) 32 track capability (explain later)
4) ease of use

Okay. It is a player of MOD files (if you haven't figured it out yet).
IT is NOT an editor, just a player (NoizeTracker, eg is an editor/player).

It is called CD PLAYER because the layout resembles a CD system (amp/controls/
l/r/etc).

32 track capability means: if you have CDPLAYER.PRG in, for example, D:\MUSIC\
MOD\, you can have 32 MOD files in that specific directory (and that's the
limit). You know how you go through a CD's tracks... well you use the arrow
(l & r) to go through 32 MOD files...
Since I have about 55 MOD files right now... I split the files into 2
directories and have a copy of CDPLAYER.PRG in each directory...
(I have 2 depictions (icons) on my NEODesk)...

Ability to cycle through the 32 files.

It plays songs a lit'l slow but it's nice...

Its at ftp terminator.cc.umich.edu (aka atari.archive.umich.edu) under:
cd atari/sound/players
bin
get CDPLAYER.(was it .ZOO or .LZH?)...

Anyway, check it out... it may suit ya!

Others:

Jukebox player v1.2 (ste/nice lit'l player (lotsa choices/no graphics)

NoizeTracker (mono/demo/quicker in playing songs)

HEY BRIAN T, I'll send ya a copy to your bbs!!!!!!!!!

2591. Mint + minix fs: any good backup programs/ideas?

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 09:34:33 UTC
From: muts@fysap.fys.ruu.nl
Message-ID: <MUTS.92Sep13113432@ruunfs.fys.ruu.nl>
Source record: 217659
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I use mint + minix on my harddisk. I wonder what good method there is to make backups of my disk. The regular TOS programs won't work because they cannot handle longer filenames and links etc.

I would use simply gnutar to /dev/ps0, and with incremental tar's this would be feasible were it not that I produce multivolume tar's in that case. I do not like this idea because to restore something on say the 5th diskette I must read all previous ones than, with the risk that if somewhere on one of the backups is wrong the rest of the backup is unusable.

Does anyone have better ideas/programs to do this job? Thanks,
--

> --
> Russel Mar (bbs.ruscal@tsoft.sf-bay.org)

You seem to be informed, maybe you'll be able to finally
answer the typical question:

What's EXACTLY this 'copy restriction flag' ?
How is this protection implemented ?

It seems that without support from the DAT itself, it isn't
possible to get this kind of protection.

In a previous article, winston@merk.com (Winston Smith) says:

>
> Isn't it amazing how in the U.S.A. these "grass roots" campaigns to
>increase ATARI awareness in the major media outlets --JUST HAPPEN-- to
>spontaneously occur whenever ATARI is launching a new product ? What a
>coincidence! Do you all remember: "THE REVOLUTION" ?
>

The REVOLUTION was a different story entirely. There isn't one person doing these campaigns and they aren't silly.

There won't be any egg hunts, Oprah write-ins, or Rosanne days.

This is probably a best time for a campaign. WHEN Atari is releasing new products.

If you wish to discuss these campaigns and have access to Free-Net, there is a discussion board on there.

These campaigns are also attempting to FIRST help correct any problems at Atari. The REVOLUTION had confidence that everything was in great shape at the company.

Yes, there are flaws like with everything else, but if you are tired of lack of support, you should say something. Everyone should say something.

2595. Calamus SL

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 14:12:31 UTC
From: david@tid.es
Message-ID: <1992Sep13.141231.9063@tid.es>
Source record: 217687

Net-beings:

I'm thinking of buying the Calamus SL package and have several questions regarding the software:

a) I understand it has gone thorugh several updates. When was the last update released? Is it a stable program?

b) I believe Calamus SL introduced the concept of modules, which could be loaded on demand. How many of these modules are there? Does Calamus SL come with some, or are they all sold separately?

c) Does Calamus SL have any special hardware requirements (memory, monitor, STE/TT)?

d) Would you recommend buying Calamus SL? How well is it supported? (The program will be used in the U.S.)

Thanks,

David Soleno

2597. Should Z*Net be created

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 14:58:20 UTC
From: Mark Kovarski <kovarski@zooid.guild.org>
Message-ID: <1992Sep13.145820.12857@zooid.guild.org>
Source record: 217664

No, I think it is a really bad idea to create Z*Net groups since you
will see 1 message per month and besides Z*Net MAG (ST) is a "cheerleading"
magazine for the ST and does not represent the reality. Its ST Editor was/is
a person that likes to control other peoples views hence he has never heard
of freedom of free speech. He is constantly bashing ST*Report and other
publications that do not agree with him or any other Atari representatives.
I think it is a total waste of time to create such newsgroups.

Sincerely,
Mark K.

2598. Can Falcon do that?

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 15:25:22 UTC
From: marsh@gwdgv1.gwdg.de
Message-ID: <QAZ6D3S@gwdu03.gwdg.de>
Source record: 217668

Hi netters,
I have been reading this group for I while now and followed the discussion on the Falcon. I am wondering if the following idea could be realized on the Falcon:
I heard that some of the new CD-ROM players, in addition to the higher transfer speed due to SCSI-II and photo CD support, will also be able to read normal audio CDs and send the digital audio data through the SCSI-II port towards the computer. Than one could let the DSP to operate on the incoming audio data in real time and than send it to the built in DA converter, or an external one through the DSP interface, than to the HiFi amp. Or, alternatively, one could send the data still in the digital domain to a DAT recorder interfaced to the DSP port. To my knowledge there should be no quality loss since the DSP can be sync-ed to an external oscillator (if my understanding on its connector is right) like that of a DAT.
I see no reason why this should not work. And if it does than the Falcon will really revolutionize the music industry. The question is wether there is good software available before others wake up. The idea of having DSP, SCSI-II, DA/AD combined with multitasking and ST compattibility is as an important milestone as the built-in MIDI was.
Possibilities include realtime multiband filtering/equalization. Or I can imagine a software which inputs the frequency response curve of your HiFi loudspeakers and corrects for that, still in the digital domain and in realtime, making the final response as flat as possible. This is the principle how the new Philips DSS digital speakers work (for above $5000).
Or one can make various spatial simulations. I think anyone could continue. To start you only need, in addition to the computer, a modern CD-ROM player and later if someone is going into that direction you can gradually build up a fully digital sound editing mastering system by adding a digital DAT/DSP interface, 1 or 2 DATs (with high quality AD/DA converters, sync option, and copy protection control options), and data storage devices of course. And all this is to be combined with the existing MIDI arsenal. I beleive this will be reality.
But, Atari please get cracken beacuse Apple is also working on a machine with DSP/SCSI-II/DA/AD capabilities (rumored as Cyclon) and probably C= is also trying to follow this neat idea.
I will change location very soon and I don't know when I have access to the net again. So please forgive me if I can't reply to the replies of this message within the usual and acceptable period of time. I will try to join to this group as soon as possible.

Tibor.

P.S. Has anyone ever compared Cubase ST and Cubase Windows? I have the impression that Cubase Windows on 33MHz 386 PC with SVGA is much much

less capable than Cubase ST on my good old 8Mhz 1040STFM concerning
especially realtime related functions.

2599. Re: Hard disk Defragmenters, any suggestions?

2601. whatis 2.0.1 posted to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 16:41:57 UTC
From: rosenkra@convex.com
Message-ID: <1992Sep13.164157.493@convex.com>
Source record: 217665

i have just uploaded whatis v2.0.1 to atari.archive. the file is whatis201.zoo
and is in ~ftp/atari/new.

this archive contains whatis, whatisin, and apropos which are parts of some
unix (BSD, i think) manual systems. these are, however, my own versions.
i use a different format for the whatis database (i use a separate file
for each manual section and include more info than just name, section,
and description (for instance entries from "SEE ALSO" sections are used
as cross references, and you can also include keywords for apropos).

here is what these programs do:

whatis given a name of a command, system call, library
routine, etc, whatis prints a one line description
whatisin prints a table of contents of the manual, or with
an argument representing a section ([0-9lno]), lists
a one line entry of all manpages for that section
apropos given a keyword, apropos prints a list of all
manpages that might be appropriate to look at (eg
"apropos file" will list every manpage that has
"file" in its name, description, or keyword list)

also include is a mkwhatis(8) program to help make the databases. also
included are some example whatis databases.

enjoy...

I am still using the first MOD player I ever got on my ST, NOISE 1.5
written by some fellow in Belgium (it has the weird keyboard layout where
an M is actually a : ...). Is there a better player out there that has a
'jukebox' ability where I can just let it play songs from a list and I
wont have to load each one manually each time the first song ends?
I haven't ever even seen an STe in person, I'm sure 4096 colors and stereo
sound is nice, but is it really worth the pain in the tail of selling my
520ST with 2.5 Meg to get an equivalent STe? I'm sort of comfortable with
my old ST. And the MODs sound pretty good from where I'm sitting....

>CD's to DATs.
>
>>--

Actually DATs sample at a higher frequency because the sound reproduction is better. I good DAT recorder will be able to record at both 44.1kHz and 48kHz, though I think these models are only available to the professionals at this point. You won't have problems copying CDs either if you convert the output of the CD to analog output (like you have to do so that you will hear the sound out of your speakers anyway) and then record it onto digital tape. Granted there will be some degeneration in the signal due to all the processing going on, but most people won't even hear the difference (unless you are a recording engineer -- since most people are not accustomed to listening that closely to the recording quality).

BTW, the reason that CDs only sample at 44.1 kHz is that when they first came out that was about the best they could do and then couldn't up the sampling rate since so many people had already bought CD players for the 44.1kHz sampling rate. It also turns out (I believe) that a sampling rate higher than 48 kHz doesn't really get you anything as far as better quality reproduction, (again see Nyquist Theorem) and does get more expensive to make good AD converters.

I just installed TOS 3.06, the AJAX controller and a 1.44 (Epson)
floppy drive in my TT. Dip switch 7 in on. It works fine by itself
on the TT, but when I take a TT FORMATTED HD floppy over to a PC, the
PC has problems with the files stored on the disk (bad crc's on ARC files
etc), but not the FAT. If the HD floppy is formated on the PC, both can
read it fine.

Any ideas about what the problem is. I believe it's either an Ajax or
drive problem. Any similar experiences?

>conjecture. Your assertion is one of ignorance, not past events.

incorrect. DAT is quite available. there are no laws in the us against DAT
machines, and no laws requiring SCMS (the digital copy protect code). the
manufacturers are putting SCMS into the machines, and the manufacturers are
keeping the prices high. can you say "SONY?"

>What has happened since then I have not followed. Here -I- am ignorant. But
>that does not change history.

the history you describe must be that of a parallel universe.

>>why do they have scms? And why is the Dat Tax being pushed through
>>Congress?

SCMS is to prevent making infinite copies of a digital recording digitally.
it is being pushed through congress by the "record companies" which are owned
by the japanese.

Well if I were you I would check out the new Diamond Edge program from Oregon Research Associates (you know, the people who made Diamond Back). It was slated for release this weekend at the Glendale fair (MMM, wish I were there!), and their ad in the latest Atari Explorer gives a pretty enticing description of it. For example, it does disk/data recovery, undelete, optimization (this is what you want), etc.

Looks like a good program, especially based on their past success with Diamond Back and Diamond Back II.

>
>-Greggy POO

Hey GREG,

Mr. Millar just told Mr. Kovarski to "shut up" -- which is basically
what you've told Mr. Millar to do.
BTW, I don't see any threats of mailing his administrator, DO YOU?

READ, THINK, and reply

2612. Request for info for 1040ST^F

Newsgroup: comp.sys.atari.st
Date: 1992-09-13 23:45:15 UTC
From: sunder@maxwell.concordia.ca
Message-ID: <4935@daily-planet.concordia.ca>
Source record: 217682

I have an ATARI SC1224 Monitor and an ATARI 1040ST^F.
I would like to use this as a terminal by conneting it
to the computer at the University by a 2400 baud modem.
I request advice in this regard.

Please direct your mail to me at

sunder@maxwell.concordia.ca

Thanking you in advance.

2613. Newstuff: uniterm?

Newsgroup: comp.sys.atari.st

From: marshall@cs.uq.oz.au
Message-ID: <10276@uqcspe.cs.uq.oz.au>
Source record: 217683

Is the uniterm which is mentioned in this week's posting of new stuff
actually an update of uniterm? If so, what's new in it?

>machines, and no laws requiring SCMS (the digital copy protect code). the
>manufacturers are putting SCMS into the machines, and the manufacturers are
>keeping the prices high. can you say "SONY?"

Please note that Rich did NOT claim that Congress passed any laws requiring copy protection. He stated that the audio industry (actually, it was the recording industry) lobbied Congress for such laws. Except for choosing the wrong adjective to describe the industry, Rich is correct. The response of DAT manufacturers was to change the specifications for the equipment BEFORE Congress could pass laws in this area.

>>What has happened since then I have not followed. Here -I- am ignorant. But
>>that does not change history.

Well, in this case it IS true... for using Paula on a plain old
ST, you need an additional program called Petra, which installs a
sound driver that allows Paula to work without DMA sound. Of
course, the results are vastly inferior to the STe or TT, but at
least it works.
Petra does not seem to be available at all sites where Paula can
be found. I got mine from a BBS... so if it can't be found at any
ftp site I could upload it to a.a.

Damn. I thought I had my kill file configured to ignore "Gregory Carter" (and "Carter Gregory", which he changed to once everyone had entered him into their kill file). I guess the auto-select on "Falcon" must have overridden the kill. Time to edit the kill file again... might as well add "Mark Kovarski" too, since he hasn't actually contributed anything useful for as long as I've watched.

And, to make this post useful, I've just uploaded "COMBAT" to a.a - it's a modern version of the old-old-olde 8-bit game. Really neat sprites (I think). 64 anti-aliased rotations! Source-code soon.

>shell script...

The machine needs lotsa memory - UNIX + X11 + OSF/Motif spells an awful lot of memory pages needed. A machine with a 16MB TT RAM works quite nicely (well, that's my opinion anyway; there are times where there are delays).

>Furthermore, it still comes along with GCC 1.39 - these days most
>people use 2.2.2. OK, you can compile it yourself, but I think
>it reflects what the guys from Atari think about updating.

>Regards, Markus.

Markus, there was no time to validate a new gcc release. Besides, the gcc2.x line is still considered beta (at best); the 1.x line is considered "stable production quality" - that's FSF's line, not mine (and it's still being maintained, 1.41 was just released). The Atari gcc was made to be a complete replacement for the AT&T/Motorola compiler, which included having to put in support for position-indep. code, ELF and DWARF, and all sort of funny compiler flags that were not "native" to gcc1.39. All that was a LOT of work.

If anyone intends to use gcc2 on ASV, I've got a configuration that works just fine for me, but hasn't gone through any sort of rigorous testing process.

2621. Re: ZOO problems (was PERFPICH.TOS v1.1 posted to a.a)

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 03:58:58 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Sep14.035858.2395@actrix.gen.nz>
Source record: 217691

When comparing .ZOO, take into mind that the MAJORITY of users will be using GEM, and not UNIX. Using ZOO v2.1 from UN*X will let you re-direct. From versions of GEM prior to 2.05, this is not possible with ZOO 2.1. TOS 2.5 and above allow for output re-direction to whatever window is currently selected, which means, you can make programs automatically put files where YOU want them. (Teradesk, and I imagine some other replacement desktops also have this feature!)

.ZOO is a LOT slower than LHarc, (in 'high compression' mode) - and fails to get as good compression. (The difference is so small it hardly matters) but speed is a real problem!

If ZOO had a redirection (which it thinks it does, but doesn't work on GEM versions<2.05). e.g.

ZOO.TTP extract C:\ZOOFILE.ZOO F:\TEMP\

[Extract command | .ZOO filename | output path/filename(s))

LHarc has this, and will also create an output directory for you if none by the specified name exists (with a prompt if so desired).

Personally, I'd rather use LZH, as I really hate waiting for things to compress. Uploading is a favour in most circumstances. Why trouble yourself with waiting longer, on top of the uploading time!? And then, if you can re-direct, copying files around!

On a certain BBS over here, I've uploaded over a hundred more files than I need to be able to download anything (And, I've got unlimited ratio anyway!)

>Is the uniterm which is mentioned in this week's posting of new stuff
>actually an update of uniterm? If so, what's new in it?

NO, it is not. Someone sent me email asking about the uniterm.tar.Z archive that was up on terminator, asking about what utilities were required to unpack it and so forth. (Tar and compress are, of course, available at atari.archive. Since they're not used for many other files on the archives, it's silly to have to download them and figure them out in order to use uniterm.tar.Z)

Seeing as how zoo 2.1 is a standard archiver on various and sundry platforms, and works everywhere on Earth (other than perhaps certain parts of New Zealand :-)), I recv'ed uniterm.tar.Z, unpacked it, and put it up as a .zoo archive.

As a .zoo archive, it should be more accessable to users that may not be familiar with the "UNIX Way of Doing Things."

In terms of Uniterm versions, this is NOT the latest edition. The latest (and final, alas) version is 2.0e015. I'm running it, even as we speak.

It is NOT available at atari.archive, and is not permitted to be. The copyright notice on this version states that people are not permitted to redistribute it to "other" ftp sites.

What is now annoying is that I can't recall (or find) the name of the site at which it IS available. Archie isn't telling me anything much that's useful. Does anyone recall the name of the site where 2.0e015 IS available? 2.0e011 seems to be easy to find at various sites.

2.0e015 was a final version incorporating a number of (unexplained) bug fixes. 011 seems to be the only stable version before 015.

Apparently Simon Poole, the authour, is now busy programming Crays, (I saw a posting around comp.lang.fortran, or something of the sort a while back) and doesn't have too much time left over for ST work.

>fails to get as good compression. (The difference is so small it
>hardly matters) but speed is a real problem!

Since they use exactly the same algorithm (hence "The difference is so small"
- the the difference in header info), it is merely particular implementations
you are talking about. All you are saying is that the particular lharc
program you use was written in assembler.

On my unix box here:

```
~/bin $ time zoo ah t.zoo foobar
Zoo: foobar - (54%) added

real 0m51.06s
user 0m43.76s
sys 0m1.65s
~/bin $ time lha a t.lzh foobar
foobar - Frozen

real 0m57.63s
user 0m51.63s
sys 0m1.56s
```

So there! (No doubt the zoo one is better merely because it has been
around longer, and so more optimizations have been made).

Seems like almost the same thing either way - they could have increased the sampling rate if they could have made the marks on the disk smaller; or they could have made the disks bigger; or they could have ... meaning I don't think you can answer the question without talking about how all the parameter values were selected.

2625. Photo Chrome - uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 06:09:24 UTC
From: shore_c@kosmos.wcc.govt.nz
Message-ID: <191aakINN76i@peponi.wcc.govt.nz>
Source record: 217696

Hello,
I've just uploaded Photo Chrome to a.a, I had a look in atari/graphics
and couldn't see it there, & assume that it isn't there somewhere else!

The file name is PCHROME.ZOO in the dir atari/new
on FTP site atari.archive.umich.edu

Here's the first part of the manual to explain a bit about it....

ATARI ST/E PHOTOCHROME v2.01

Concept, Design and Programming

by Douglas Little.

(C) 1992 Pixel Twins Shareware Utilities.

You are now the proud owner of the PhotoChrome graphics card
emulator. It is the only one of its type currently available for the Atari
ST and is capable of out-performing all other screen modes including the
infamous HAM and HalfBrite displays on the Commodore Amiga.
It's basic specification is the ability to load most IFF formats,
24-Bit QRT and REAL-3D Raytraced screens (16 million colours) and
VidiChrome digitised 'RGB' colour separations (4096 colours) before
converting to one of six powerful screen modes.

THE 6 CONVERSION MODES

The six screen modes are...

1.Spectrum 512> 42/45 cols per scanline from 512 on an ST or STE.
2.Spectrum 4096 > 42/45 cols per scanline from 4096 on an STE.

3.PCS-ST> 48 colours per scanline from 512 on an ST or STE.
4.PCS-STE> 48 colours per scanline from 4096 on an STE.

5.Super HAM> A full 4096 colours out of 4096 on an ST or STE.
6.STE PhotoChrome> 19200 colours out of 32768 on an STE.

Modes 1 and 2 are basically real Spectrum-512 files. They are not
compressed, but Spectrum can do this if you need it. STE mode seems to
handle pictures better than I had expected, since with such a large palette
the colour assignments tend to be used up twice as quickly.

Modes 3 and 4 are my own custom versions of the Spectrum display.
They both have a few extra colours to play with, filling up the streaks
and dots Spectrum can often leave behind. This is my own 'PCS' format
(PhotoChrome Screen) and uses the best of 2 compression methods.

Modes 5 and 6 are actually impossible, so just accept they work
and don't ask too many questions!

SUPER HAM is an emulation of the Hold And Modify mode normally
exclusive to the Commodore Amiga. After some experimentation with my
own Amiga, I found that HAM is not actually as capable of displaying
the more complex colour images (especially with high levels of contrast
or lots of sharp lines) and so renamed my own format 'SUPER HAM'.

PHOTOCHROMEis only available when the source picture contains in
excess of 4096 colours (i.e. QRT 16-million colour pictures), and then
only to STE owners. However, if you do have an STE and some RAW files
knocking about (STF cover disk 35!) then you are in for a treat indeed!
Eat your heart out, VGA! This is the most powerful mode available short
of a real Graphics card, with 19200 colours on-screen at once from a
largish palette of 32768! (15-bit colour). The picture requires two
conversion passes, but is well worth the wait!

N.B. Pictures saved out as Super HAM or PhotoChrome tend to be
anywhere from large to enormous, even with fancy compression. Bear this
in mind when testing out the hatched and fractal stippling options!
(Check out PCSVIEW.DOC for info on better compression...)

Well Mark you have this a little wrong and for your information
alt.znet.fnet is carring about 80-120 messages a night. That is right
80-120 messages per evening straight out of the Z*NET FNET echo's
from people all over North America and here in Pacific. Kinda
blows your theory of one message a little astray.

> magazine for the ST and does not represent the reality. Its ST Editor was/is

Mark, wow what a mouthful. I think we are victim of what you voice
your concerns on here. While I do not want to get into a them vrs us
flame here on the net I think you make a GOOD case for one.

Remember Mark this is for the good of all users of Atari machines
not just Z*NET or STR readers so how about keeping petty flames OUT
of the net and put them on Bounty BBS where they belong.

2629. code for playing 6 bit samples ?

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 07:39:01 UTC
From: M.P.Wood@lut.ac.uk
Message-ID: <1992Sep14.073901.29785@lut.ac.uk>
Source record: 217698

I am writing a 16 bit sample editor and want some way of previewing the
samples without midi dumping them to my sampler.

I have seen some code in the 'Midi and Sound Book for ST' that plays
6 bit samples. As I don't truely understand 68000 code or where certain
registers are -
Could someone please post/email some details (pref in 'C')
or point me to a FAQ or something.

It does not look that hard its just that it has this Triple Load thingy.
Whats that ?

Thanks,
Mike.

2630. Commerical Software and Fergus McNeill

Newsgroup: comp.sys.atari.st

Ads in software? Okay! If you really want it. But just pushing the prices down a bit would certainly help. If you take a look at the "old days" with the Sinclair Spectrum and the C64, when a "normal" game would cost round seven to eight pounds sterling, and the most expencive ones would cost a maximum of 14.95 GBP, people were more likely to buy them. Nowadays, 14.95 is supposed to be a budget game!!! These games used to cost 2.5 GBP, which is the average price of a disk from a PD library nowadays.
Who do you think sell the most software? PD libraries or any softwr. company? To make people continue buying from the software companies, they try BIG titles, like James Bond, Terminator, etc. etc. But the games don't seem to get any better because of that. If you take a look at the Addams family, you'd notice that the game is much more alike the game than the film - or the cult series. This is probaly because they wanted to sell it while the title still was hot, and then they won't have time to make a REAL game.
Selling the games for a smaller amount of money will make better value for money, and more will buy. However, forgetting the hot titles and make GAMES instead, would make even more people buy. I guess the software market is too commerical as it is. Please don't make it any worse.

And BTW; Does anyone out there have any old Fergus McNeill games for the good ol' Sinclair Spectrum??!? I'd love to buy them - for a reasonable price...

Just a few points here:
1: Quantity does not neccessarily mean quality. Is the PC better than the NeXT just because more PCs have been sold than NeXTs? Is VHS better than Super 8? Is New Kids On The Block better than, say, Metallica? God forbid!

2: The Falcon has GREAT hardware, and at the assumed prices, it's a winner!

3: There is no reason to continue debating on this subject, really. Let's fill up the "Commerical Software" collumn a bit...

Watch out for FS2. It's one of those absolute loaders. Around $10000 I think.
Bit of a bummer with TSRs and ACCs loaded. I find it rewarding to put it in an
RDY bootable RAMdisk which loads in upper memory. Bypass HD booting too.
You don't get delays then while flying. But I digress ...

>MIDI ports. Anything like this around?

Hi,

If the beta test version had not that one @#$% last minute bug,
I would have announced the new version of PLAYBACK.PRG right now.

Version 1.0 is already available on several archives (look for: PLAYBACK.ZOO).
Currently beta test version 1.04 is spread around to beta testers and
in two weeks I will spread version 1.1 around.

PLAYBACK is not a DA or background program, but can play standard MIDIFILES,
via the atari ST MIDI out port.

Version 1.1 wil run on all (ROM) TOS versions available,
It will run on all ST/STE/MEGA/TT/FALCON computers (tested at Dusseldorf Messe!),
It will run on all resolution/colours (as long as at least 80 characters can be
displayed on a single line, and min. 25 lines fit on the screen. Note that it uses
these sizes to make the program resolution independent while using GEM!)

Version 1 could only load/play/adapt/analyse songs.
The new version also can save the song, do midifile format conversion, and
has a lot of new features to easier adapt the song to your MIDI setup. So it
is pretty efficient to use (I prefer it to use it for trying out MIDIFILES I get
-including adapting these files to my personal MIDI setup-,even though I do own
C-lab's Notator program too).

The program can do much more. It can be installed in the desktop: just double
clicking a *.MID file will startup the program. You even can set the program's
preferences in such a way that it will start playing the song and quit the
program as soon as the song is over. Or if you prefer a CLI... no problem!

Etc.

So please, two more weeks...

John.

I do not think that you understand basic sampling theory. Please look it up.
A sine wave of up to 35kHz can be represented by a sampling rate of 70kHz.
You are right that, if sampling at exactly 70kHz, you cannot tell the
difference between DC and 35kHz, but anything less than 35 is fine.

According to your descriptions above, a CD should have a bandwidth of about
10kHz or less!

The other frequency is 32kHz. I read somewhere (Sound-on-Sound mag I think)
that this rate is used in radio broadcasting.

>I don't know if digital copy is easy to get (I believe there is another
>protection). My knowledge in this domain is a bit too limited !
>(and I don't have neither a CD nor a DAT)
SCMS is designed to allow exactly one digital copy. The copy cannot be
further duplicated digitally. Pro DAT players do not have SCMS, and
a box to defeat the system is available quite cheaply. Some domestic DAT
machines will not record digitally at 44.1kHz, to prevent digital pirating
of CDs.

EL GATES (egates@triton.unm.edu) wrote:
: Actually DATs sample at a higher frequency because the sound reproduction
: is better.

Erm, are you sure about this? Granted, the anti-aliasing filters need
be less steep, but the sigma-delta converters ofte used today make
that less of a worry.

: BTW, the reason that CDs only sample at 44.1 kHz is that when they
: first came out that was about the best they could do and then couldn't
: up the sampling rate since so many people had already bought CD players
: for the 44.1kHz sampling rate.

This is utter nonsense. 44.1kHz was used because video tape recorders
were used to master CDs, and thus the sampling rate had to be a
multiple of the TV scan frequency.

: It also turns out (I believe) that a
: sampling rate higher than 48 kHz doesn't really get you anything as far
: as better quality reproduction, (again see Nyquist Theorem) and does
: get more expensive to make good AD converters.

Not so much that, as the fact that it reduces the storage capacity of
the media. Running the DACs faster is not a problem, as the
popularity of oversampling converters will attest.

2642. TOS 2.06 solves hardware problem of MEGA STE

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 11:52:14 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Sep14.115214.27408@echo.philips.nl>
Source record: 217648

Seeing so much negative things about atari going around, I think it is time
to tell you my good experience with their service.

After being a 520 ST user for 6 years, I bought a MEGA STE last year.
Like all other MEGA STE users then, I had those problems with the video
shifter within several programs. One of the symptoms was that the screen
flipped around: The .5" (1 cm) which should be at the right side was flipped
to the left side.

I reported about this on the net then. I even got a new video shifter chip
from atari here and my local dealer replaced it. However, it did not help,
the symptoms remained.

At the Dusseldorfer messe I spoke with Atari BENELUX, and they told me that
I needed TOS 2.06 to solve it. Suspicious as I was, I didn't want to pay
for a problem in the machine which I reported already when the machine was
still under warranty- besides, the new TOS 2.06 did not have so many new
features for a TOS 2.05 user anyway.

After a nice talk, the guy from atari asked my address and he said he would come
back on it. Few days later, I received a letter, containing the 2.06 ROMS!

And what's more...
They did solve the screen problem!

John.

The most easy thing to do is write a short C program that does the
random thing and calls your favourite MIDI file player. If you're smart,
you might even build in the possibility to set an environment value
that determines what the name of your midi file player is, and what
basic arguments you want to give it. Please post it if it's finished :)

>parameter values were selected.

The truth is, they made the disc larger to hit the 74 minute mark. The
sampling rate spec didn't change. This is from one the the Japanese
engineers working on the project, so its probably reliable :-).

2650. ST questions: GCC 2.2, FPUs and image converters

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 16:05:16 UTC
From: don@terminus.gatech.edu
Message-ID: <1992Sep14.160516.28840@cc.gatech.edu>
Source record: 217614

Three unrelated (or somewhat related) questions:

1. In other groups I've read that GCC 2.2 is the version to use and that 2.1 is buggy and shouldn't be used any more. Someone here mentioned an ST port of 2.2 but I haven't been able to find such an item at any of the ftp sites. Has 2.2 been ported to the ST, and if so, where could I find a copy?

2. Having just put an ICD AdSpeed STE in my system and added a floating point coprocessor, I was looking for a compiler that would support using a 68881 as a peripheral, like the ST's do. Does such a critter exist? I tried Laser C which supposedly has a library that supports this option, but noticed no time differences when running with software emulation or the hardware coprocessor (30000 adds, also 10000 sines seemed to take the same amount of time either way). I was hoping to see some of the claimed 10x speedup in some raytracing software I was going to port.

3. I have some .TGA files on my PC that I want to convert to PI3 (I think? the monochrome one anyway) to use as backgrounds on my STe. The utilities I've tried (Chameleon on the ST--I also looked at picswitch(?)--and piclab on the PC) don't have compatible file lists. Any suggestions on what utilities would be the best to do this conversion, and pointers as to where to get them?

Thanks,
Don Allison

>
>Thanks. J.H. c556212@MIZZOU1.missouri.edu

Defragmenters are mostly marketing hype that your friend seems to have swallowed whole. Do defraggers make reads faster? They can. It really depends upon your usage of your HD. If you create and delete lots and lots of files often, then a defragger might help. All it really does is make sure reads are done in a contiguous block, instead of taking the time to step here and step there and thrash all over your drive. If you've the room on your drive, you can achieve the same thing for NOTHING by copying all your files to a partition, deleting all the files from the destination, then copying from the partition back to the destination.

human hear.. Andrew Haley@eoe.co.uk (1276)
> This is utter nonsense. 44.1kHz was used because video tape recorders
> were used to master CDs, and thus the sampling rate had to be a
> multiple of the TV scan frequency.

> Andrew.

Just a little question:

is TV scan frequency 22.05, 14.7 or 11.025 Khz ?

I mean, 44.1 Khz is NOT a multiple of horizontal scan frequency
and I can't see any other relevant frequency in TV scan
(vertical is much too low, dot bandwidth is much too high)

Stefan Monnier

2653. DAT Stuff (was sampling and human hearing range)

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 19:08:57 UTC
From: trw@spl1.spl.loral.com
Message-ID: <1992Sep14.190857.25275@wdl.loral.com>
Source record: 217619
Cross-posted to: comp.sys.atari.st,rec.audio,sci.skeptic

A couple of erroneous comments have been raised about DAT technology:

1) You can't make a digital copy of a CD due to the copy protection.

FACT: You CAN make a direct digital copy of a CD at the standard
44.1kHz sampling frequency onto a DAT cassette (as long as
your CD player has digital outputs). What you CAN'T do is
make a digital copy of a DAT recording from one DAT deck to
another if the Serial Copy Management System (SCMS) is
used by the DAT machine and the recording was made from a
CD at the 44.1kHz sampling rate. This prevents digital
copying of something that was recorded from a CD. This, of
course, doesn't stop anyone from making a million digital
copies of a CD from the CD itself.
DAT recordings made at the 48kHz sampling rate may be copied
digitally DAT to DAT.

2) The DAT sampling rate is 48kHz.

FACT: True, but not the whole picture. DAT samples at 48kHz for
recordings made from anything but a direct CD source. Some
professional DAT decks allow the sampling rate to be set
at 44.1kHz even if the source is not a CD. This allows a
CD "Master" to be made that could be transfered to CD with
no DA/AD conversion. Someone pointed this out.

FACT: Many DAT decks also provide a "long play" recording mode which
reduces the sample quantization from 16 bit to 12 bit, the
sampling rate from 48 kHz to 32kHz, and the tape speed is
halved. This doubles the time capacity of a DAT cassette and
reduces the frequency response to 5 - 14,500 Hz. All other
specs remain practically identical.

2655. Phantom Typist? (and other things)

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 19:45:25 UTC
From: elvis@watserv.ucr.edu
Message-ID: <22369@galaxy.ucr.edu>
Source record: 217620

Hi,
I remember long ago hearing about the Phantom Typist. At the time I had never experienced any such thing, so foolhardy soul that I am, I ignored all the information about it. However, since I upgraded to Tos 1.4 (and at the same time I installed a D.E.K.A. and IBM keyboard) I have been having problems with the computer thinking that keys are being held down.
Sometimes it doesn't happen at all, sometimes it happens quite frequently. It also does not seem to matter if I have used the keyboard at all. The favorite keys for this seem to be ALT and ESC. The latter is particularly annoying on the desktop, as it updates the windows many, many times before the buffer clears. As soon as I hit the repeating key for real, it stops. By the time I realize what is going on, however, there's usually quite a number of the character in the buffer. Anyways, does this sound like the Phantom Typist? If so, was there ever any solution discovered? Any help would be appreciated.

Also, I was wondering if anyone has information on PowerDOS yet, like where it is available? I know that DragonWare is realising it as freeware, but do you have to get it from them? Or will it be available at anonymous sites? Or has there been no word yet? Am I simply rambling?

Thanks in advance for any replies,

Andrew Cullum (elvis@watserv.ucr.edu)

>> 80286 AT class machine. Of course, a faster Atari will help but with the

I'd generalize further, and skip the "By and large." ALL IBM
emulators for the Atari will be pretty slow because the 680x0 is not
quite the same as an 80x86. Vice versa, it takes a very powerful
80x86 to emulate a 68000. (None of this actually proves anything
about the relative power of either Motorola or Intel lines. It's
frankly a pretty stupid idea in many ways to try to make one emulate
the other since an emulation will have all of the undesirable features
of both!)

>Not so!!! AT-Speed C16 (an internal IBM emulator) is running inside my
>MegaST 4 at 12.9 Mhz. There are speed test one can run to find oute
>exactly how fact their system is running. There is also a 386
>emulator available for the ST. Since AT-Speed C16 is a 286 emulator I
>would expect the 386 emulator (also made by the people who make AT-Speed)
>runs even faster.

You aren't talking about an emulator. Some marketing droid may call
it an emulator, but it is NOT. An emulator is something that pretends
to be something else. The AT-Speed does not emulate an 80286 - it
actually HAS an 80286 on board. Similarly, the "386 emulator" will
ACTUALLY have an 80386 (or perhaps one of the competing clone chips)
on board.

The Mihoka Gemulator, on the other hand IS a true emulator since it
makes an 80{3,4}86 pretend that it's a 68000. The original PC Ditto
was a true emulator (and I don't remember hearing any hard info about
any other actual emulator), and was brutally slow because of this.

Amazing coincidence, isn't it? So do I! Unless, of course, you are suggesting that *I* do not have the same rights as mr. Kovarski, which WOULD be descrimination, wouldn't it? Yes, I think so.....
The bane and boon of the modern media, is that they have the right to publish whatever they want (to a certain degree). The abundance of "tabloids" is the proof of this. After a while, certain people take advantage of the situation and publish whatever they want, whether it is truth of fiction - it gets to a point where the practical and the in-pratical start showing through. If you hadn't noticed, Mr. Kovarski's posts have been, to put it lightly, rather ridiculous.......chock full of half-truths and lies......if YOU want to waste your time reading and BELIEVING this trash, that is your right - but, I also have a right to speak out against such garbage - case closed!

Remember "Greggy" - THINK before you reply........(for you maybe it should be : Think BEFORE you reply...........)

2662. GhostScript 2.4.1 TT version available

Newsgroup: comp.sys.atari.st
Date: 1992-09-14 21:44:42 UTC
From: wenzel@marsu.tynet.sub.org
Message-ID: <H.ea.J7R_r&3y&gA@marsu.tynet.sub.org>
Source record: 217533
Cross-posted to: comp.sys.atari.st,de.comp.sys.st

Hello!

I recently compiled a TT version of Tim Gallivan's Port of GhostScript 2.4.1.
For compilation I used GNU C 2.2.2 (including -m68020 -m68881) and a TT
version of GNU library PL82. The binaries should run under MiNT as well as
under plain TOS and can simply be configured by environment variables.
I also included Tim's GEM shell for GhostScript (GemGS) in version 1.2.

The packet containing the adapted sources and the binaries is available on

ftp.uni-stuttgart.de (129.69.1.12)

directory: /soft/atari/TT/MiNT/apps

If any problems with the binaries occur, please contact me via email,
questions/bug reports/fixes concerning the sources should be addressed to
Tim Gallivan.

Enjoy,
Markus.

PS: Other interesting TT-compiled binaries can be found there, too!
Just have a look, I think it is worth it.

>empty processor slot?

Ya ever notice that the quotes always say "386SX" for that processor-direct slot? The slot is a *68000* bus-slot, i.e., 24 bit address and 16 bit data. Dunno why they'd put a 68000 bus into a 68030-based system, but it's there, with all the glue needed to make 68030 control signals look like 68000 control signals. Weird. And also makes a very explicit statement about the system, it is not intended to allow peer-to-peer "parallel" processing, but to allow a less-powerful "slave" processor. So forget the thought of having two 68030s running in parallel, or any other dream of that sort, it isn't really workable.
>

As an interesting footnote, the preliminary Falcon docs were available at the Glendale Atari Fair. A few of the pages still had references to "Sparrow" scattered in the text. Fancy that, eh?

Interesting. If ".TGA" means what I think (TARGA) then you want to convert some 24-bit true-color images into ST 640x400 monochrome? Yeehah.

The PC version of FractInt reads and writes TARGA files. You can probably use it to read them and save as GIFs, which you can then convert to some other format easily enough.

What program do you use on the PC to display these TGA files, anyway?

Michtron has a very good de-fragmenter called Tool-Kit. It also is good for backing up hard drives, and repairing damaged data. I also believe that ICD has a de-fragmenting program as well. Of-course you can alway de-fragment your hard drive by 1st backing it up and then restoring it.

Also you can reduce the amount of time it takes to backup your hard drive by placing all of your programs on one or two partitions and placing the data created with your programs on other partitions.

Since the programs themselves never change there will be no framentation of them and you'll only have to do one backup of those partitions. The partitions which contain data will be the partitions you'll need to backup. I have five partitions on my hard drive. two partitions contain my programs the rest of my hard drive is used to store data. When I do a back up (once a week) I only backup those three partitions containing my data. This technique (sp?) greatly reduces the amount of time spent doing backups.

That's an interesting idea, but there are flaws to this.
For one: It would be too expensive for non-computer companies
to support software.
2: Your monitor would look like a tv (with commercials)
3: It's not the same (like a billboard, actual sounds/visual...)

I think that the idea of shareware is better or a scheme like
that brought on by the authors of Freeze Dried Terminal (where
the authors give $5 to each $20 they receive from a user to the
distributor).

Piracy is a problem...

There is code at atari.archive, I believe it has "881" in the title,
find it in the index. Probably in progaramming, or in the gnustuff/tos
area. This code deals with peripheral 68881 use, but I'm not sure in
what way.

Len;

Although I personally don't hold out much hope for your success, I do
wish you the best of luck. I do remember the Revolution and did
take part in it. I even got some letter back from some of the companies
I sent them to. They all seemed to say the same thing, "I'm not going to
do Atari's job for them". This is once again doing Atari's job for them.
Atari needs to advertise their product to the general public. I'm not
talking about the few advertisements place in some of the professional

musician magazines, nor am I talking about a few advertisements placed in some of the gaming magazines. What is needed to inform the general public about the wonderful qualities of the Atari computer is an indepth advertising campaign. This included newspaper ads, magazine ads, TV ads, radio ads, etc. Yes, this is very expensive, but if Atari Corporation is going to live on it is going to have to do this.

I know for a fact that Atari developers are moving away from the Atari platform. I was talking to a developer who lives in Girade Ohio. He is in the process of porting all of his Atari programs to the IBM because, as he says, I can't make a living writing for Atari". Dr. T has just announced it is dropping all support for Atari, Hybrid Arts no longer exists (yes I know it has been purchased by Barefoot Software). The point is, if Atari would do its homework and advertise its computers to the general public we would be gaining developers, not losing them.

Again, Good Luck with your campaign. I have downloaded my form and intend to fill it out and send it to you. If there is any further help that I can be in your quest please let me know. I have to advise you at the outset that I really don't hold out much hope of any success, but, as true Atarians we do have to try, don't we.....

I have the following atari items for sale, as I just sold my computer
today:

software: (includes boxes and docs)
DBMan (database III+ clone)
LDW Power (VP Planner clone - Lotus comp)
Flight Simulator II (color STe version)
Mig 29 Fulcrum - special addition with book on mig
GST C compiler
Michtron SuperConductor MIDI sequencer

hardware:
ST analog monitor cable
4 mode docking bay joystick with option stick/thumb control and auto-fire
generic joystick (flight style 2(parallel) buttons)
2 joystick extension cables

Books:
Compute Atari ST programmers guide
Abacus books - almost complete set - titles I remember
Atari ST Gem Reference Guide
Atari ST Internals
Atari ST 3d Graphics programming
Atari ST Graphics and sound
Atari ST Peeks and Pokes
Atari ST MIDI programming
(might be more)

Other misc:
NAP analog amber monitor (video and audio inputs)
6502 assembly programming (book)

Make offer(s) if you are interested (be sure to include whether or
not your offer is with or without shipping)

Source record: 217503

Does someone have a list of IBM-"emulators" for Atari ST series computers ? Is there a portion of a FAQ that mentions them ??

Prices (list/market) would be nice also.....

Specifically..... what can one stick in/attach to a Mega ST or a Mega STe to get it running MS Windows (I'd be happy with 3.0)....

Someone here has a Mega ST 2 and he'd like to run some MS-DOS stuff and I'd like to be able to run some MS-DOS stuff on my mega STe.....

WHat ? Well, I can't speak for the other person..... but for myself... I'm working with DEC's All-in-1 product and I'd like to try out their All-in-1 Desktop For PC's so I can send mail to/from my ST at home... without having to get UUCP running on a machine at work & on my ST... and since the chances of DEC ever writing/supporting a similar product on the ST are slim to none I'd like to use a PC emulator on my ST and save the Powerbook I plan on getting for Hypercard and other innocuous activities

(Can we say "We live in a multivendor environment :-)so why not take advantage of it ?" ???)

I have a HUGE stack of ST magazines I'd like to sell...
STart (even #1), ST-Log, ST Applications, Compute's Atari ST,
ST-Express, the list goes on...even some from the
U.K. (Atari ST User, ST World). None of them have disks.
There are about 60 of them, altogether. Leave me e-mail
if you are interested (I don't typically read this
conference...more of an 8-bit sort.) I'm hoping to sell
the whole bundle for about $30 (and that includes shipping)...
I'm not interested in making a huge profit. I just don't
want to throw them away (I am sure someone wants them)
and the shipping is going to cost a lot (they are HEAVY).

Hi there,

david@tid.es (David Soleno) wrote:

d>a) I understand it has gone thorugh several updates. When was the last
d>update released? Is it a stable program?

The last official update is from the 4th (or 5th) of June (or July, i just
can't remember this dates).

d>b) I believe Calamus SL introduced the concept of modules, which could be
d>loaded on demand. How many of these modules are there? Does Calamus SL
d>come with some, or are they all sold separately?
Yes, Calamus SL uses modules. In fact, nearly everything in Calamus SL is done
through modules (even the frame editor). There are modules enclosed in the
calamus package, and there are other modules which you have to buy if you need
them.

d>c) Does Calamus SL have any special hardware requirements (memory,
d>monitor, STE/TT)?
You'll need much ram and a fast machine. You can work with Calamus SL on an ST
with 2 meg, but it ist awful. At least you'll need 4 MB and a 16MHz machine,
but a TT with much ram is much better!

d>d) Would you recommend buying Calamus SL? How well is it supported? (The
d>program will be used in the U.S.)
Yes! It is a very good program and the support in germany is good. There are
further developments under work and there will be new version of Calamus SL. As
far as i know there is a distributor in the US, but i don't know exactly. I
know there's a distributor in Canada.

But i think that Pierre Hansen (pierre_hansen@mz.maus.de) could give you some
more information because he's working for DMC. If he doesn't reply to your
message just send him an email letter.

I have a problem with gulam.
Sometimes I have several files with the same name.
ls gives exactly the same information for all of
them. When I remove one, the other ones remain.
Some of the programs I run under gulam seem to know about
one file only.

It happens with an editor and a Lisp interpreter.
I can give details to anybody who could help finding
the reason of this problem. Perhaps it's a known bug ?

It's true! A Mac High Density disk is formatted MFM just like PC and Atari HD disks. I just tried reading a Mac HD disk using Norton Disk Editor on a PC and although I couldn't fathom the file system the sectors were readable and the filenames were there. This could mean good news for Spectre running on Atari's with HD drives. No need for GCR. I don't see why we couldn't end up with a 'Mac Mounter' for our machines. Maybe a MiNT loadable file system too.

Well, I've already got Playback, and it's pretty smart- easily the best
MIDI player I've seen- but what I really want is something which'll
play stuff while I go and word process/ draw pictures/ play tetris :)
or whatever at the same time. Someone mailed me and said they'd got
an old DA called "MYMSP" which can play MIDI files (though not at
random) does anyone else know whether this is any good? Is it already
on the net anywhere? He offered (very kindly) to upload it to atari.
archive if I couldn't find it elsewhere, but it'd be faster if it

was already available somewhere. (I couldn't find it on archie.) TIA...

I detect a hint of sarcasm here? The point being made was that
_Cubase_Windows_ was less capable than ST Cubase- not particularly
surpising, given that ST Cubase has been around three years longer,
and has several features that Cubase Windows doesn't. (Can't
remember exactly what- there's a thread on rec.music.synth and
rec.music.makers about this at the moment; I'll look it up if you're
really interested).

There are digital standards conversion units to transcode from various sampling rates to any desired rate without going through an analog process. Good CD mastering labs do this regularly.

>Does someone have a list of IBM-"emulators" for Atari ST series

Andy, others in this group may add their $.02, but the only PC emulators that I know as being currently supported are the ICD AT-Speed and PC-Speed units which are priced around $400 and $200, respectively. I don't believe the SuperCharger (sold by Talon?) is supported any longer although you might still find the units for sale. And frequently you may find a PC-Ditto II hardware board for sale as well as the PC-Ditto software only solution (works but very s-l-o-w).

There is not a tremendous market for PC emulators anymore because you may now buy a standalone PC for not much more than the cost of these emulators.

Anyone know of any other PC emulators?

Just returned from the Glendale show in southern California. While we had loads of fun (as should be expected), renewed old friendships and began new ones, we found (subjectively) that attendance was down from previous years.

Congrats to Jason (?) who won the Atari Falcon 030 plus 1 year of free online time on GEnie as the major doorprize. Certainly worth the price of admission!

Would like to hear other views from Glendale attendees; particularly how they felt about the show in general and reaction to Atari's Falcon demos, pep talks, etc.

> I imagine some other replacement desktops also have this feature!)

What I do is open a window that has ZOO.TTP in it, then open a
window with the zoo file, and then open a window with the destination
direcory. Then, making sure the destination window is on top, I
double-click on ZOO.TTP while holding down the right mouse button. The
box dialog box comes up, I type in the full pathname for the zoo file,
and let it go. It puts everything in the directory that is in the top
window. (Although using a shell is a lot nicer, this method works.)

Just as an update, Jerry Pournelle DOES have a Falcon now (or at least, soon will have) as he attended the Glendale Atari Show this weekend and spent a long time with Bill Rehbock and Bob Brodie of Atari. Due to deadlines and long lead times, we likely won't read of his impressions in Byte until the Jan or Feb issues though.

It would be nice to make the cover of Byte again (like the 1040ST did when it was introduced as the first PC with 1Mb for under $1K).

>
>I'm not sure how Spectre GCR works. Why is the external drive needed?
>Can't it use the internal drive?

To use the GCR, a drive cable runs from the Spectre cartridge to the external drive port on your ST. If you have an external drive as well, it plugs into the GCR cart. These are necessary so the Atari drives can read/write the Mac 800K format. Using the 1.4Mb drives, such additional h/w would not be necessary, only a s/w patch.

>Also, can't Dave write some kind of fix for it?

I'm sure he could, but is it worth his while?

>I wonder if Atari contacted Dave Small about the external drive port...

I doubt it. Why would they?

>They seem to be putting him out of business... First is was the
>Mega ST expansion port, then there is the Falcon with the increased
>speed that a lot of people will no doubt purchase instead of his SST,
>and now there is no floppy port for his Spectre...

Gadgets by Small is not about to go out of business, unless and until Dave Small decides to do something else. The Spectre GCR, MegaTalk, and SST all still seem to be selling very well, or at least as fast as they can make them!

2703. PLEASE HELP: GDB won't load my program

Newsgroup: comp.sys.atari.st
Date: 1992-09-15 18:46:49 UTC
From: svleest@jobim.crhc.uiuc.edu
Message-ID: <195b2pINN454@roundup.crhc.uiuc.edu>
Source record: 217521

I am having problems getting gdb, the GNU debugger, to work.
When I compile a program for debugging and then use sym-ld to
build the symbol table, all is fine. I then run gdb. I can use
"info function" to list all the functions in my test file.
HOWEVER, if I then try to run the program, it exits IMMEDIATELY, with
the message:

Program exitted with status = -32

This happens regardless of how simple or complex test.prg is.
What am I doing wrong? I have noticed that if I use examine
to look at the program data, it reports everything is 0 (I use x/10d at
multiple locations, and everywhere it is 0). Is this because
gdb does not actually load the program until you command it to
"run", or is this part of my problem? I have the following versions:

gdb 2.6 Patchlevel 18
gcc 1.40 Patchlevel 2
gcc-ld and sym-ld Patchlevel 27
gulam cli

I used the following command sequence:

```
>gcc -c -g -D__NO_IN_LINE__ test.c
>gcc -o test.ttp test.o
>sym_ld -r -o test.sym crt0.o test.o -l gnu
>gdb -e test.prg -s test.sym
*run
```

(where ">" is the gulam prompt, and "*" is the gdb prompt) and I
get the error described above. I have tried this with nothing else
but my hard disk driver, gulam, and gdb loaded (no ACCs, etc.) and
it still bombs.

Any help would be greatly appreciated!

2704. Falcon030: Higher res. simple!

Newsgroup: comp.sys.atari.st
Date: 1992-09-15 18:54:45 UTC
From: kosmatoo@JSP.UMontreal.CA
Message-ID: <1992Sep15.185445.19395@cc.umontreal.ca>
Source record: 217522

Aparently, it is easy to get the Falcon030 to display higher resolutions
than the ones it comes "standard" with. At the Atari Messe, a company
called OVERSCAN explained that the Falcon can accept an external monitor
frequency sync. signal. It is a built in feature of the Falcon that is
quite interesting. You can, by using an apropriate external sync. generated
by a crystal, increase the resolution in the Falcon to things like
1024x800 in 256 colors, or what have you. This does not slow down the
computer at all, until you increase the resolution to the extent that
the video chip starts hogging its share of the memory bandwidth.

One of the Atari rep's, when asked why the resolution was limited to
640x480 when it was so easy to get better resolutions by changing the
sync (The AES supports it, too), said that they wanted to avoid the situation
where some beginner uses a cheap VGA monitor, and the freq. being too high
would cause the monitor to "blow." (?!). So they decided to leave the
simple upgrade to 3rd party developpers. (I'm not kiding...)

Also, OVERSCAN already had a program that gave the falcon a higher resolution
256 color mode (I wont state the res, because I forgot) completely in
software. It did not slow down the computer, they claimed.

So basically, by the time the Falcon is available to us here in N.America,
there should be no problem in getting the Falcon to work in higher
resolutions. It may cost the price of a small add-on, or perhaps we
will get a shareware program to do close to the same.

Something to verify:

The Falcon love-30's DSP, has 4 times the private memory available to it
(32K words) than the NeXT's DSP has available to it. (The NeXT's only has
8K words private ram). The Falcon's DSP runs at 16 MIPS at the current
frequency (32Khz).

What follows were things that were said by Norman Kowalewski, an Atari Rep.
at the Atari Messe. (In charge of software development for the Falcon love-30.)

-> Atari is working on a machine by the name of Falcon040.
-> Atari is working on a higher end-Falcon030, too.
-> Atari has no plans to make ASV, the Unix, run on a Falcon030, but
it "will" be made to work on "the" Falcon040 they are working on.

Interesting *RUMORS* I heard at the Atari-Messe and elsewhere:

-> The Falcon040 will have MULTIPLE DSP chips, perhaps even 96K ones.

Sounds like a fun machine to fool around with at home...

2707. GFA: Interrupt programming fails in TT-RAM

Newsgroup: comp.sys.atari.st
Date: 1992-09-15 20:34:46 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <1992Sep15.203446.141116@rrz.uni-koeln.de>
Source record: 217525
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi everyone,

I recently got a hold of the File-Info/Config CPX and used it to set the TT-Ram bits of a program I wrote and compiled under GFA basic 3.6. The program contains a procedure that is called every 1/5 seconds by the command "EVERY 40 GOSUB procedure". While this has worked fine with the TT-Ram (Prg) bit unset, it doesn't work when this bit is set.
To investigate this phenomenon, I wrote a test program (included below). It basically consists of the EVERY command, followed by a loop that should then be interrupted by interrupt procedure at regular intervals. With this test program, I found out the following:

1. If there are 4 PRINT commands between the EVERY command and the loop (let's call this program "TEST_A.PRG"), the interrupt works in ST Ram and doesn't work in TT Ram.
2. If there is just one PRINT command between the EVERY command and the loop ("TEST_B.PRG"), the interrupt (now read this!) works in TT Ram and fails in ST Ram!
3. Lately, I installed the ARROWFIX.PRG in my auto folder. Since then, TEST_A.PRG runs properly with or without the TT-Ram bits set, and TEST_B.PRG fails with both TT-Ram bit settings.

Fortunately, my original program seems to belong to the "A"-category, so it is magically fixed by ARROWFIX. However, I am severely confused. Any idea how these *weird* findings can be explained?
In the GFA basic manual it is explained that the EVERY command is realized with the etv_timer vector ($400), if that is of any significance.

Greetinx, Jan

+- Jan Kim -- X.400: S=kim;OU=vax;O=mpiz-koeln;P=mpg;A=dbp;C=de -+
| Internet: kim@vax.mpiz-koeln.mpg.dbp.de |
| |
----=< hierarchical systems are for files, not for humans >=-----

P.S.: You may flame me for programming in GFA basic if you must. But please include code for implementing equivalents of the EVERY command in your favorite language in this case. ;-)

Here's the code of the test program:

```
' TEST_B.GFA
$I+
$U+
~TT?
CLS
ON BREAK CONT
DIM mbuf&(7)
EVERY 40 GOSUB show_interrupt
PRINT "Every is now activated"
'
' Un-comment either the three prints or the wave to obtain TEST_A.GFA
' PRINT
' PRINT
' PRINT
' WAVE 1,1,0,1000,20
'
t%=TIMER
REPEAT
$U
IF TIMER-t%>200
PRINT "Hi there, the main loop has idled for another second..."
t%=TIMER
ENDIF
UNTIL MOUSEK=2 OR INKEY$=CHR$(27)
$U-
$I-
PRINT "see ya"
~INP(2)
EDIT
'
PROCEDURE show_interrupt
EVERY STOP
PRINT "Hi, I'm the interrupt procedure."
EVERY CONT
RETURN
```

2708. Need Vt100 codes.

Newsgroup: comp.sys.atari.st
Date: 1992-09-15 20:44:37 UTC

I need codes for VT100. I a doc file on this posted to this group a while
ago, but going through some 1000+ previous posts yielded nothing.
Could some kind soul repost or e-mail me this info?
Thanks!

The original questions delt with the ability of the ST to emulate an IBM style computer i.e., IBM or IBM clone. The individual who posted the original message had heard that these IBM emulators were extremely slow and is so wanted to know it he should just go out and make the purchase of an IBM/IBM clone. My response was to inform him that this was not the case. If you choose to not call any of the hardware IBM "emulators" for the ST emulators is, as far as I'm concern, a mute point. If I want to to run IBM software on my ST I want the fastest device I can have to do it with. I don't care what it's called, or how it works. I only want it to do the job I want done. I believe most users are of the same mind as I am.

2710. Re: help : several files with the same name in Gulam

Newsgroup: comp.sys.atari.st
Date: 1992-09-15 21:45:44 UTC
From: wabe@ukc.ac.uk
Message-ID: <1622@eagle.ukc.ac.uk>

>Some of the programs I run under gulam seem to know about
>one file only.
>
>It happens with an editor and a Lisp interpreter.

I have noticed a similar phenomenon - but, in my case, it usually arises after I've packed some executable with the ICE-Packer. The packed files occasionally (not always!) become undeleteable and if you do an "ls" command in Gulam you see more than one identically named file. I have often had to resort to the use of DLII to delete these files!! I'm not convinced that this is a GULAM problem - it could be a TOS problem or indeed something peculiar about the way the ICE Packer writes out its packed executables. I have noticed this duplication often on RDY ramdisks but it does happen on normal floppies also.

When there is duplicity of files, GULAM usually finds the earliest in the directory listing. This is usually not the most recent. If you can delete this then, next time, GULAM will find the correct file.

Explanations gratefully solicited. Cheers, W. Alan B. Evans

yes.. you all asked for it (well at least 10...)
here are the ansi vt100 codes for cursor control.
it is somwhat edited, since a lot was DEC specific and other stuff.
if you want the whole file.. just mail me
but this is the good stuff:

This file describes information needed for controlling the VT100 terminal from
a remote computer. All of the information was derived from the VT100 user's
manual, Programmer's Information section. Full documentation can be obtain
from DIGITAL'S Accessory and Supplies Group.

ANSI mode w/cursor ANSI mode w/cursor
Cursor Key VT52 mode key mode reset key mode set

UP A [A OA
DOWN B [B OB
RIGHT C [C OC
LEFT D [D OD

****
* Special Graphics Characters *
****

If the Special Graphics set is selected, the graphics for ASCII codes
0137 through 0176 will be replaced according to the following table (see the
SCS control sequence).

Octal ASCII Special Octal ASCII Special
Code graphic graphic code graphic graphic

0137 _ Blank 0157 o Horiz Line - scan 1
0140 \ Diamond 0160 p Horiz Line - scan 3
0141 a Checkerboard 0161 q Horiz Line - scan 5
0142 b Digraph: HT 0162 r Horiz Line - scan 7
0143 c Digraph: FF 0163 s Horiz Line - scan 9
0144 d Digraph: CR 0164 t Left "T" (|-)
0145 e Digraph: LF 0165 u Right "T" (-|)
0146 f Degree Symbol 0166 v Bottom "T" (|_)
0147 g +/- Symbol 0167 w Top "T" (T)
0150 h Digraph: NL 0170 x Vertical Bar (|)
0151 i Digraph: VT 0171 y Less/Equal (<_)
0152 j Lower-right corner 0172 z Grtr/Egual (>_)
0153 k Upper-right corner 0173 { Pi symbol
0154 l Upper-left corner 0174 | Not equal (=/)
0155 m Lower-left corner 0175 } UK pound symbol
0156 n Crossing lines (+) 0176 ~ Centered dot

NOTE 1: Codes 0152-0156 and 0164-0170 are used to draw rectangular grids" each
piece of this set is contiguous with other so the lines formed will be
unbroken.

NOTE 2: Codes 0157-0163 give better vertical resolution than dashes and
underlines when drawing graphs; using these segments, 120 x 132 resolution may
be obtained in 132 column mode with the Advanced Video Option installed.

****
* Terminal Control Commands *
****

Control Characters

The control characters recognized by the VT100 are listed below. All
other control characters cause no action to be taken.

Control characters (codes 00 - 037 inclusive) are specifically excluded
from the control sequence syntax, but may be embedded within a controlsequence.
Embedded control characters are executed as soon as they are encountered by the
VT100. The processing of the control sequence then continues with the next
character recieved. The exceptions are: if the character occurs, the
current control sequence is aborted, and a new one commences beginning with the
just recieved. If the character (030) or the character (032)
occurs, the current control sequence is aborted. The ability to embed control
characters allows the synchronization characters XON and XOFF to be interpreted
properly without affecting the control sequence.

Control Octal
Character Code Action Taken

0000 Ignored on input; not stored in buffer
0005 Transmit ANSWERBACK message
0007 Sound bell
0010 Move cursor to the left one position, unless it is at
the left margin, in which case no action is taken.
0011 Move cursor to the next tab stop, or to the right
margin if no further tabs are set.
0012 Causes either a line feed or new line operation (See
new line mode.)
0013 Same as .
0014 Same as .
0015 Move the cursor to the left margin of the current line.
0016 Invoke the G1 character set, as designated by the SCS
control sequence.
0017 Invoke the G0 character set, as selected by the (
sequence.
0021 Causes terminal to resume transmission (XON).
0023 Causes terminal to stop transmitting all codes except
XOFF and XON (XOFF).
0030 If sent during a control sequence, the sequence id
immediately terminated and not executed. It also
causes the error character (checkerboard) to be
displayed.
0032 Same as .
0033 Introduces a control sequence.
0177 Ignored on input; not stored in buffer.

The VT100 is an upward and downward software compatible terminal; that is, previous DIGITAL video terminals have DIGITAL's private standards for control sequences. The American National Standards Institute has since standardized escape and control sequences in terminals in documents X3.41-1974 and X3.64-1977.

The VT100 is compatible with both the previous DIGITAL standard and ANSI standards. Customers may use existing DIGITAL software designed around the VT52 or new VT100 software. The VT100 has a "VT52 compatible" mode in which the VT100 responds to control sequences like a VT52. In this mode, most of the new VT100 features cannot be used.

Throughout this document references will be made to "VT52 mode" or "ANSI mode". These two terms are used to indicate the VT100's software compatibility.

NOTE: The ANSI standards allow the manufacturer flexibility in implementing each function. This document describes how the VT100 will respond to the implemented ANSI central function.

NOTE: ANSI standards may be obtained by writing:

American National Standards Institute
Sales Department
1430 Broadway
New York, NY, 10018

Definitions

Control Sequence Introducer (CSI) - An escape sequence that provides supplementary controls and is itself a prefix affecting the interpretation of a limited number of contiguous characters.
In the VT100, the CSI is: [

Parameter: (1) A string of zero or more decimal characters which represent a single value. Leading zeros are ignored. The decimal characters have a range of 0 (060) to 9 (071).
(2) The value so represented.

Numeric Parameter: A parameter that represents a number, designated by Pn.

Selective Parameter: A parameter that selects a subfunction from a specified set of subfunctions, designated by Ps. In general, a control sequence with more than one selective parameter causes the same effect as several control sequences, each with one selective parameter, e.g., CSI Psa; Psb; Psc F is identical to CSI Psa F CSI Psb F CSI Psc F.

Parameter String: A string of parameters separated by a semicolon.

Default: A function-dependent value that is assumed when no explicit value, or a value of 0, is specified.

Final character: A character whose bit combination terminates an escape or control sequence.

EXAMPLE: Control sequence to turn off all character attributes, then turn on underscore and blink attributes (SGR). [0;4;5m

Sequence:

Delimiters
/ \
/ \
| |
\ / \ /
[0 ; 4 ; 5 m
^^^^^^ ^ ^ ^ ^
|||||| | | | |
\||||/ \ | / +------Final character
\||/ \ | /
CSI Selective
Parameters

The octal representation of this string is:

033 0133 060 073 064 073 065 0155
[0 ; 4 ; 5 m

Alternate sequences which will accomplish the same thing:

1) [;4;m

2) [m
[4m
[5m

3) [0;04;005m

Control Sequences

All of the following control sequences are transmitted from the Host to VT100 unless otherwise noted. All of the control sequences are a subset of those defined in ANSI X 3.64 1977 and ANSI X 3.41 1974.

The following text conforms to these formatting conventions:

1) Control characters are designated by angle brackets (e.g. the Escape character is).

2) Parameters are indicated by curly braces.

3) Parameter types usually are indicated as one of:

{Pn} A string of digits representing a numerical value.

{Ps} A character that selects an item from a list.

{a-z} Any lowercase sequence of one44 or more characters in braces represent a value to be entered (as in {Pn}), and the name in the braces will be referred to in explanatory text.

4) Spaces in the control sequence are present for clarity and may be omitted. Spaces which are required will be surrounded by single quotes: ' '.

5) All other characters are literals.

CPR Cursor Position Report VT100 to Host

[{Pn} ; {Pn} R Default Value: 1

The CPR sequence reports the active position by means of the parameters. This sequence has two parameter values, the first specifying the line and the second specifying the column. The default condition with no parameters present, or parameters of 0, is equivelent to a cursor at home position.

The numbering of the lines depends upon the state of the Origin Mode (DECOM).

This control sequence is sent in reply to a device status report (DSR) command sent from the host.

CUB Cursor Backward Host to VT100 & VT100 to Host

[{Pn} D Default Value: 1

The CUB sequence move the cursor to the left. The distance moved is determined by the parameter. If the parameter missing, zero, or one, the cursor is moved one position. The cursor cannot be moved past the left margin. Editor Function.

CUD Cursor Down Host to VT100 & VT100 to Host

[{Pn} B Default value: 1

Moves the cursor down a number of lines as specified in the parameter without changing columns. The cursor cannot be moved past the bottom margin. Editor Function.

CUF Cursor Foreward Host to VT100 & VT100 to Host

[{Pn} C Default Value: 1

The CUF sequence moves the cursor to the right a number of positions specified in the parameter. The cursor cannot be moved past the right margin. Editor Function.

CUP Cursor Position

[{Pn} ; {Pn} H Default Value: 1

The CUP sequence moves the curor to the position specified by the parameters. The first parameter specifies the line, and the second specifies the column. A value of zero for either line or column moves the cursor to the first line or column in the display. The default string (H) homes the cursor. In the VT100, this command behaves identically to it's format effector counterpart, HVP.

The numbering of the lines depends upon the state of the Origin Mode (DECOM). Editor Function.

CUU Cursor Up Host to VT100 & VT100 to Host

[{Pn} A Default Value: 1

Moves the cursor up without changing columns. The cursor is moved up a number of lines as indicated by the parameter. The cursor cannot be moved beyond the top margin. Editor Function.

DA Device Attributes Host to VT100 & VT100 to Host

[{Pn} c Default Value: 0

1) The host requests the VT100 to send a DA sequence to indentify itself. This is done by sending the DA sequence with no parameters, or with a parameter of zero.

2) Response to the request described above (VT100 to host) is generated by the VT100 as a DA control sequencewith the numeric parameters as follows:

Option Present Sequence Sent

No options [?1;0c
Processor Option (STP) [?1;1c
Advanced Video Option (AVO) [?1;2c
AVO and STP [?1;3c
Graphics Option (GPO) [?1;4c
GPO and STP [?1;5c
GPO and AVO [?1;6c
GPO, ACO, and STP [?1;7c
<<

Top Half: #3
Bottom Half: #4

These sequences cause the line containing the cursor to become the top or bottom half of a double-height, double width line. The sequences should be used in pairs on adjacent lines with each line containing the same character string. If the line was single width single height, all characters to the right of the center of the screen will be lost. The cursor remains over the same character position, unless it would be to the right of the right margin, in which case it is moved to the right margin.

DECDWL Double Width Line (DEC Private)

#6

This causes the line that contains the cursor to become double-width single height. If the line was single width, all characters ro the right of the center of the screen will be lost. The cursor remains over the same character position, unless it would be to the right of the right margin, in which case it is moved to the right margin.

DECID Identify Terminal (DEC Private)

Z

This sequence causes the same response as the DA sequence. This sequence will not be supported in future models.

DECINLM Interlace Mode (DEC Private)

This is a private parameter to the RM and SM control sequences. The reset state (non-interlace) causes the video processor to display 240 scan lines per frame. The set state causes the video processor to display 480 scan lines per screen. See MODES, RM, and SM.

DECKPAM Keypad Application Mode (DEC Private)

=

The auxiliary keypad keys will transmit control sequences.

DECKPNM Keypad Numeric Mode (DEC Private)

>

The auxiliary keypad keys will send ASCII codes corresponding to the characters engraved on their keys.

DECLL Load LEDs (DEC Private)

[{Ps} q Default Value: 0

Load the four programmable LEDs on the keyboard according to the prameter(s).

Parameter Meaning

0 Clear All LEDs
1 Light L1
2 Light L2
3 Light L3
4 Light L4

DECOM Origin Mode (DEC Private)

This is a private parameter to SM and RM control sequences. The reset state causes the origin (or home position) to be the upper left character position of the screen. Line and column numbers are, therefore, independent of current margin settings. The cursor may be positioned outside the margins with a cursor position (CUP) or horizontal and vertical position (HVP) control.

The set state causes the origin to be at the upper left character position within the current margins. Line and column numbers are, therefore, relative to the current margin settings. The cursor cannot be positioned outside of the margins.

The cursor is moved to the new home position when this mode is set or reset. Lines and columns are numbered consecutively, with the origin being line 1, column 1.

DECRC Restore Cursor (DEC Private)

8

This sequence causes the previously saved cursor position, graphic rendition, and character set to be restored.

DECREPTPARM Report Terminal Parameters VT100 to Host

[{sol} ; {par} ; {nbits} ; {xspd} ; {rspd} ; {cmul} ; {flags} x

This sequence is generated by the VT100 to notify the host of the status of selected terminal parameters. The status sequence may be sent when requested by the host (via DECREQTPARM) or at the terminal's discretion. On power up or reset, the VT100 is inhibited from sending unsolicited reports.

The meanings of the sequence paramters are:

Parameter Value Meaning

{sol} 1 This message is a report.
2 This message is a report, and the terminal is
only reporting on request.

{par} 1 No parity set
4 Parity set and odd
5 Parity set and even

{nbits} 1 8 bits per character
2 7 bits per character

{xspd} 0 Speed set to 50 bps
-and- 8 Speed set to 75 bps
{rspd} 16 Speed set to 110 bps
24 Speed set to 134.5 bps
{xspd}= 32 Speed set to 150 bps
Transmit 40 Speed set to 200 bps
Speed 48 Speed set to 300 bps
56 Speed set to 600 bps
{rspd}= 64 Speed set to 1200 bps
Recieve 72 Speed set to 1800 bps
Speed 80 Speed set to 2000 bps
88 Speed set to 2400 bps
96 Speed set to 3600 bps
104 Speed set to 4800 bps
112 Speed set to 9600 bps
120 Speed set tp 19200 bps

{cmul} 1 The bit rate multiplier is 16

{flags} 0-15 This value communicates the four switch values
in block 5 of SET-UP B, which are only visible
to the user when an STP option is installed.

DECREQTPARM Request Terminal Parameters

[{Ps} x

The host sends this sequence to request the VT100 to send a DECREPTPARM sequence back. {Ps} can be either 0 or 1. If 0, the terminal will be allowed to send unsolicited DECREPTPARMs. These reports will be generated each time the terminal exits the SET-UP mode. If {Ps} is 1, then the terminal will only generate DECREPTPARMs in response to a request.

DECSC Save Cursor (DEC Private)

7

Causes the cursor position, graphic rendition, and character set to be saved. (See DECRC)

DECSCLM Scrolling Mode (DEC Private)

This is a private parameter to RM and SM control sequences. The reset state causes scrolls to "jump" instantaneuously one line at a time. The set state causes the scrolls to be "smooth", and scrolls at a maximum rate of siz lines/sec. See MODES, RM, and SM.

DECSCNM Screen Mode (DEC Private)

This is a private parameter to RM and SM control sequences. The reset state causes the screen to be black with white characters; the set state causes the screen to be white with black characters. See MODES, RM, and SM.

<<<>>>
DECSTBM Set Top and Bottom Margins (DEC Private)

[{Pn} ; {Pn} r Default Values: See Below

This sequence sets the top and bottom margins to define the scrolling region. The first parameter is the line number of the first line in the scrolling region; the second parameter is the line number of the bottom line of the scrolling region. Default is the entire screen (no margins). The minimum region allowed is two lines, i.e., the top line must be less than the bottom. The cursor is placed in the home position (See DECOM).

DECSWL Single-width Line (DEC Private)

#5

This causes the line which contains the cursor to become single-width, single-height. The cursor remains on the same character position. This is the default condition for all new lines on the screen.

DECTST Invoke Confidence Test

[2 ; {Ps} y

Ps is the parameter indicating the test to be done. It is computed by taking the weight indicated for each desired test and adding them together. If Ps is 0, no test is performed but the VT100 is reset.

Test Weight

POST (ROM checksum, RAM NVR, keyboardm and AVO) 1
Data Loop Back (Loopback connector required) 2
EIA Modem Control Test (Loopback connector req.) 4
Repeat Testing until failure 8

DSR Device Status Report Host to VT100 & VT100 to Host

[{Ps} n

Requests and reports the general status of the VT100 according to the following parameters:

Parameter Meaning

0 Response from VT100 - Ready, no faults detected
3 Response from VT100 - Malfunction Detected
5 Command from host - Report Status (using a DSR control sequence)
6 Command from host - Report Active Position (using a CPR sequence)

DSR with a parameter of 0 or 3 is always sent as a response to a requesting DSR with a parameter of 5.

ED Erase in Display

[{Ps} J Default: 0

This sequence erases some or all of the characters in the display according to the parameter. Any complete line erased by this sequence will return that line to single width mode. Editor Function.

Parameter Meaning

0 Erase from the cursor to the end of the screen.
1 Erase from the start of the screen to the cursor.
2 Erase the entire screen.

EL Erase in Line

[{Ps} K Default: 0

Erases some or all characters in the active line, according to the parameter. Editor Function.

Parameter Meaning

0 Erase from cursor to the end of the line.
1 Erase from the start of the line to the cursor.
2 Erase the entire line.

HTS Horizontal Tab Set

H

Set a tab stop at the current cursor position. Format Effector.

HVP Horizontal and Vertical Position

[{Pn} ; {Pn} f

Moves the cursor to the position specified by the parameters. The first parameter specifies the line, and the second specifies the column. A parameter of 0 or 1 causes the active position to move to the first line or column in the display. In the VT100, this control behaves identically with it's editor counterpart, CUP. The numbering of hte lines depends upon the state of the Origin Mode (DECOM). Format Effector.

IND Index

D

This sequence causes the cursor to move downward one line without changing the column. If the cursor is at the bottom margin, a scroll up is performed. Format Effector.

LNM Line Feed/New Line Mode

This is a parameter to SM and RM control sequences. The reset state causes the interpretation of the character to imply only vertical movement of the cursor and causes the RETURN key to send the single code . The set state causes the character to imply movement

to the first position of the following line, and causes the RETURN key to send the code pair . This is the New Line option.

This mode does not affect the Index (IND) or the next line (NEL) format effectors.

MODES The Following is a list of VT100 modes which may be changed with Set Mode (SM) and Reset Mode (RM) controls.

ANSI Specified Modes

Parameter Mnemonic Function

0 Error (Ignored)
20 LNM Line Feed/New Line Mode

DEC Private Modes

If the first character in the parameter string is ? (077), the parameters are interpreted as DEC private parameters according to the following:

Parameter Mnemonic Function

0 Error (Ignored)
1 DECCKM Cursor Key
2 DECANM ANSI/VT52
3 DECCOLM Column
4 DECSCLM Scrolling
5 DECSCNM Screen
6 DECOM Origin
7 DECAWM Auto Wrap
8 DECARM Auto Repeat
9 DECINLM Interlace

Any other parameter values are ignored.

The following modes, which are specified in the ANSI standard, may be considered to be permanently set, permanently reset, or not applicable, as noted.

Mnemonic Function State

CRM Control Representation Reset
EBM Editing Boundary Reset
ERM Erasure Set

VEM Vertical Editing NA

NEL Next Line

E

This cuases the cursor to move to the first position of the next line down. If the cursor is on the bottom line, a scroll is performed. Format Effector.

RI Reverse Index

M

Move the cursor up one line without changing columns. If the cursor is on the top line, a scroll down is performed.

RIS Reset to Initial State

c

Resets the VT100 to the state is has upon power up. This also causes the execution of the POST and signal INT H to be asserted briefly.

RM Reset Mode

[{Ps} ; {Ps} l

Resets one or more VT100 modes as specified by each selective parameter in the parameter string. Each mode to be reset is specified by a separate parameter. See MODES and SM.

SCS Select Character Set

The appropriate D0 and G1 character sets are designated from one of the five possible sets. The G0 and G1 sets are invokedd by the characters and , respectively.

G0 Sets G1 Sets
Sequence Sequence Meaning

(A)A United Kingdom Set
(B)B ASCII Set
(0)0 Special Graphics
(1)1 Alternate Character ROM
Standard Character Set
(2)2 Alternate Character ROM
Special Graphics

The United Kingdom and ASCII sets conform to the "ISO international register of character sets to be used with escape sequences". The other sets are private character sets. Special graphics means that the

graphic characters fpr the codes 0137 to 0176 are replaced with other characters. The specified character set will be used until another SCS is recieved.

SGR Select Graphic Rendition

[{Ps} ; {Ps} m

Invoke the graphic rendition specified by the parameter(s). All following characters transmitted to the VT100 are rendered according to the parameter(s) until the next aoccurrence of an SGR. Format Effector.

Parameter Meaning

0 Attributes Off
1 Bold or increased intensity
4 Underscore
5 Blink
7 Negative (reverse) image

All other parameter values are ignored.

Without the Advanced Video Option, only one type of character attribute is possible, as determined by the cursor selection; in that case specifying either underscore or reverse will activate the currently selected attribute.

SM Set Mode

{Ps} ; {Ps} h

Causes one or more modes to be set within the VT100 as specified by each selective parameter string. Each mode to be set is specified by a seperate parameter. A mode is considered set until it is reset by a Reset Mode (RM) control sequence. See RM and MODES.

TBC Tabulation Clear

[{Ps} g

If the parameter is missing or 0, this will clear the tab stop at the cursor's position. If it is 3, this will clear all of the tab stops. Any other parameter is ignored. Format Effector.

------*** Cut here ***----

Enjoy!

2712. ST-RAM in a TT upgrade?

Newsgroup: comp.sys.atari.st
Date: 1992-09-15 22:00:46 UTC
From: paul@jupiter.noname
Message-ID: <1992Sep15.150048.3700@arizona.edu>
Source record: 217529

I've got a TT with only 2 Megs of ST RAM and was wondering what a good price for another 2M ST RAM would be (and maybe where from). I'm sure it's cheaper then TT RAM, which I definitely can't afford right now, and I'd also be able to use it with Spectre.

-Thanks!

-Paul Harris

^^^^^^^^^^^
>window with the zoo file, and then open a window with the destination
^^^^^^^^^^^^^^^^^^^^^^^^
>direcory.

You don't even need to have that window open. You just have to be able
to run ZOO with the destination window on top. With TOS 2.0x, you could
probably even put ZOO.TTP on the desktop and cut it to one window.

> Hello, thank you for reding my message. Really the title says it all.
>Do you know where a program called petra is. It (I was told) fools software
>specifically Paula into thinking you have a DMA sound chip.

Yes, that's exactly what Petra is all about. I read through the text files accompanying petra and it says there that Petra is shareware and may be distributed via BBS and PD systems. So I figured I could upload it to an ftp site. I chose athene.uni-paderborn.de, because that's where I found Paula. Petra's current location at athene.uni-paderborn.de is /atari/incoming/petra.arj. Doing anonymous ftp, you can't view the incoming/ directory, but you can still download petra with the ordinary "get petra.arj" command.
I'm telling this in such detail because I'm not sure if my way of uploading to the ftp site was correct. Especially, I'm wondering whether I'm supposed to drop a note to the manager of the ftp site explaining what the uploaded stuff is. Any comment on this would be appreciated.

Perhaps there is a public-domain thesaurus. The "Project Gutenburg" has
made a Roget Thesaurus available on-line. I'm not really sure what the
distribution restrictions are though.

>The libraries that come with GCC will support the FPU.

Thanks for the pointer...I was worried that since most 680X0 systems running
GCC that have a math coprocessor use it in coprocessor mode instead of as a
peripheral like the 68000 does, that GCC only supported the coprocessor mode.
Guess it's time to find and read the compiler documentation...

The Supercharger is a stand alone 4.77 Mhz IBM XT emulator. Condor Trading U.K. were the world wide distributors for the Supercharger range. In June '91 Condor announced the Supercharger SC286Plus 16Mhz IBM emulator, only a few of these units were ever released for sale. The Supercharger ranger are no longer supported as Condor Trading went into liquidation in April of this year owing thousands of pounds to customers, advertisers & staff. I should know as these bastards ripped me off $920.00 !!! The Fraud Squad in England investigated this company for me but they could do little apart from giving me the German address of the listed owner of Condor Trading. I'm going to ask my brother who lives in Germany to look him up...

Won't work. Sorry. They're designed to work on ST systems only,
although there was some company that purportedly made a cable that
would allow them to work on an Amiga. Also, some Roland (?) keyboard
devices could use them. But not IBMs. (They're not smart enough to
deal with 'em. So what's new about that?)

The title says it: Is there a more recent version than this of Jens
Pirnay's TeXDraw program ?

This one is one year old and it seems that the author has stopped
developing it.

I'm especially interested in the implementation of splines, als well in
the conversion of GEM-Metafiles into TeX-Code.

Does anybody know what the state of the thing actually is ?

Thanks,
Thomas.

>with all the glue needed to make 68030 control signals look like 68000
>control signals. Weird.

Are you sure about that? While I was at the Glendale show on Saturday, I asked about the PDS slot and what signals it has - Bob Brodie had his tech person (I forget his name just now) answer my question: According to him, the PDS slot has all of the Address and Data pins of the 030 (he said 32 each) and all of the interupts and "other system signals" - including the most important signals - bus ack and bus grant. In his own words, he said it will allow the addition of a 386 <no sx> or 486 <no models are 16bit> or other high-performance processors that with the busack/grant will allow you to run on the new processor and "put the '030 to sleep"

You cannot do that with a slave processor.

He put some fears to rest (for me) but can someone with a Falcon in his/her hands say for sure whether Bob's tech person was right, or whether the documentation is right?

BTW, did they publish the machine's logic diagrams with the rest of the falcon docs? I had to finagle to get the TT's diagrams since it was not available with the normal dev2 docs...

>As an interesting footnote, the preliminary Falcon docs were available at the
>Glendale Atari Fair. A few of the pages still had references to "Sparrow"
>scattered in the text. Fancy that, eh?

I think perhaps this is a sign that the falcon's docs (like the docs for all the other machines) were made from preliminary-release versions of the machines. Like in the dev. docs for the TT, they always mention it as having a 16MHz processor :) - this I know is not true. Perhaps they had originally designed the Falcon to have a slave PDS and then added the rest upon further consideration. If such is the case, then I don't care WHY they went with the full implementation, I would just be glad they did. That would mean that high-speed processor (386,486,'040,'060), memory, and graphic upgrades will be relatively painless (can you imagine trying to get a 64MB memory upgrade into a 16-bit bus? I thought not.

From: piet@cs.ruu.nl
Message-ID: <1992Sep16.073927.29755@cs.ruu.nl>
Source record: 217556

I had the same problem before I had TOS 1.4. It would happen when editing a file. I remember that I was working on a C program and tried to debug it. When I found an error, I corrected it, compiled it and the error wouldn't disappear. Until I detected that old versions of the file with the same name were still lying around and these were the ones that got compiled. I think it is a TOS bug (in older TOS versions). I suspect something that under some circumstances TOS forgets to delete the older file if you do an Fcreate. That may also be the reason that some C libraries do a Fdelete first before the Fcreate.

True, you can convert between 44.1kHz and 48kHz without going analogue, but it requires decimation and interpolation (ie there will be a digital filter somewhere along the line), and this WILL impart some distortion on the signal. Obviously, a good implementation will make the distortion pretty low, but by recording at 44.1kHz in the first place, you can avoid this step.

On the subject of 48kHz, I have recently seen someone write (in a mag) that 48 is used 'in the television industry'. Anyone know what this means (eg is 48kHz the source data rate for NICAM encoders?).

Not quit, although...

Let me tell you how I recognise the everlasting phantom typist:

When typing at average (slow) speed, you suddenly realise that you made a typo.
You hit the Backspace or Delete keys a few time and then it comes, immediately
(thus very fast) after the last Backspace key hit, you restart normal typing again.
And, voila, le phantom typist!

The first few newly typed characters (after the last Backspace) are being repeated
at a very low frequency again and again. Most times, this results in a
non-interruptable sequence, so all you can do is reset the machine.
Some people, though, have managed to stop it by immediately pressing the ESC
key or they even managed to get the file save function working before the
phantom typist went into the non-interruptable sequence. (Note that pressing
ESC sometimes stopped it, but I never had that luck).

Now the question: how come?

All the net has been able to found out was the following:
The editor (or other application) handles key input in a non standard way.
The program is trying to give the user a nice feature, but GEM offers no way
to do it nicely. I mean the following: When typing normally, you like to type
ahead, even if the program cannot follow that quickly. A good editor allows
those things. However, typing some characters or function keys, you do _NOT_
want the type ahead, for example: Backspace, Delete line, etc. (I know this
is a matter of taste, so do not flame!). Lots of wordprocessors and even editors
works this way.

Gem only allows you to either wait for keyboard events or using other functions
to get the keyboard status. So as soon as a backspace or delete function comes
in via the event function, the program should check if that key is still being
pressed. This is done to see if the key should still be handled.

Now it comes:
If already another key is pressed in available in the input buffer of the event

handling functions of GEM, while you process another kind of i/o function for the same kind of input, the phantom typist arises.

Atari warns for this by saying not to use different levels for the same i/o devices mixed in a program. However, there is no other way to create the above feature within a program then by mixing AES, and bios functions...

Hope this helps understanding the problem.

So wait a second after deleting stuff, before typing the new stuff will surely help to avoid the phantom typist to arise.

2730. Photo Chrome - uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-09-16 09:20:57 UTC
From: jensk@hpbbrd.bbn.hp.com
Message-ID: <86010054@hpbbrd.bbn.hp.com>
Source record: 217358

I tried to run this on my system (1985 ST, PAL color TV) and it `sort of'
worked. I could convert RAW images (generated by Rayshade, but in QRT format)
to Spectrum 512, but I couldn't get the PCS-ST and SUPER HAM modes to work
in 50 Hz. Unfortunately, my TV doesn't like 60 Hz at all.

What I get in those two modes at 50 Hz doesn't even remotely resemble the
original. There are lots of white pixels, and lots of colored streaks.

Does anybody know what could cause this (timing problems, ...) ? I'm
not that experienced in this sort of multi-color hackery.

Thanks in advance,

Jens.

GEMSZRZACC is not pd or Shareware, you only got it, when you pay your
Shareware-fee to Michael Ziegler. GEMSZRZ is 'Shareware' and only up
to V1.9b available.

You can use ZModem with RUFUS, when you use the extern-slot.

The ST version of LHARC is programmed in assembler; the ZOO is a
ported C-source. That's why LHARC is faster on an ST. Drawback is the
decreased (:-) portability of a machinecode file. That's why I still
use ZOO.

>Sorry for posting this to "atari.st" but I know there are a bunch of TeX`ites out
>there,

>Bob Malay

GF stands for 'Generic Font', which is the format MetaFont outputs.
TFM stands for 'TeX Font Metric' and contains the font metric
information used by TeX itself to typeset your document. To print or
preview it, you need the real font bitmap, usually a compressed format
called PK. There must be some kind of GFTOPK on your SPARC, I guess.
Now MetaFont creates both a GF *and* a TFM, so I'm baffled as to where
that TFM is gone. It could be, however, that some option is set to
delete the TFM as it's not needed more than once, so when you make a
font for, say, a new printer, the TFM's wouldn't be different and thus
not be needed. It's not so nice of course, that there's no check on
whether the TFM already exists or not. Ask a local wizzard how to
switch off the option. Oh, before that, take a look in the MFOUTPUTS
directory (may be called differently on your particular machine, but
the $MFOUTPUT(S?) environment variable should be pointed to it,
'course that's where MF normally stores it's output.

Hope this helps.

You can use Rufus aloso without this .ACC. Perhaps you should try
Rufus 1.11 Rel9 which should be available on several german fileservers.

To get this (very useful) GEMRZSZ.ACC please contact Michael_Ziegler@m.maus.de.

It is shareware and you'll need DM 30,- to register and get a copy of the
latest version.

Great! I'm going to claim those as well! For my 1040STE that is!
(hihi)

I suppose that's reasonable since I do have problems with screen savers
and such? If so, I suggest we all go and tease Atari! That'll force them
to test their ROMs a little bit better than they currently do (remember
the hard drive problem for STEs:- I had to travel to Atari BENELUX about
four times to get that right; in the end they replaced the whole SH204.)

I recently upgraded my Mega from 2 to 4 Meg for $50+ in parts. I bought 16
RAM chips for $3/each plus $2 for the shipping from one of the companies that
deals in used components. (I bought a package of resistors from Radio Shack
and already had the capacitors.) I don't have the invoice, and forget the
name of the company that sold me the RAM chips -- there is a tabloid called
PROCESSOR that has a regular set of ads from companies wanting to buy used
silicon. I called one of them and asked if they were willing to sell me the
chips and struck a deal. The ST RAM chips are fairly slow by today's standards
(120 ns?) and not as expensive as the current, 70ns memory. I think you can
contact the publishers of PROCESSOR at 800-247-4880. They have a lot of other
stuff, like disk drives, printers, and so forth.

>
>emulator-smemulator, who cares? In common parlance, we use the term to discuss
>a hardware or software tool which allows us to execute software written for another
>platform. Construction is not important... performance & compatability is!
>

I know what happened! Chris got confused between emulating an IBM PC and
emulating an Intel processor! The ST emulates an IBM PC (or suitable clone)
by using a software emulation of the the IBM's processor or having a hardware
assist from an Intel processor (or suitable clone). My dictionary gives the
following for emulator:

---

em-u-la-tor \'em-ye-,laEt-er\ n
(1589)
1: one that emulates
2: hardware or software that permits programs written for
one computer to be run on another usu. newer computer

The first, recursive definition is expanded by the following:

1em-u-late \'em-ye-,laEt\ vt -lat-ed; -lat-ing
[L aemulatus, pp. of aemulari, fr. aemulus rivaling --
more at ETIOLOGY]
(1589)
1a: to strive to equal or excel
1b: IMITATE; esp: to imitate by means of an emulator
2: to equal or approach equality with

2em-u-late \-let\ adj, obs
(1602)
:EMULOUS 1a <pricked on by a most emulate pride --Shak.>

****
The quibble may be valid in regards to whether AT-SPEED emulates the 286 --
maybe it doesn't. I do think, however, that AT-SPEED and similar
products do allow the ST to emulate an IBM-PC. Now, can we get back to

bashing other people's computers?

>frequency component.

Sorry dude. You are on the wrong side of the equation. Your equation assumes that you can output true sin wave outputs, and yes, with the right sin/cosine waves you can _approximate_ a square/triangle wave. But a computer is on the other side - you have a machine that outputs what are basically square waves (no such thing as a true square wave as there is always some capacitance - and such a velocity would tear your speaker diaphram (sp?)). You are trying to approximate a sinusoidal wave with discrete method of continual samples - a more appropriate mathematical metaphor would be examining how a Gausian approximation works on a complex function. As delta->0 of the distance between gauge points of the function (these are the sampled points of the function), you get a more accurate approximation of the function. As delta -> 0, your frequency -> infinity. Of course a computer cannot sample at infinite Hz...so you limit yourself to the frequency domain you wish to stay in (enter Nyquist, et all). Of course there have been other means of improving on Gaussian approximation (the names escape me) - but they involve most of the techniques found in oversampling, and as such they are better left in the output functions, rather than in the raw data (where they would only make your data larger but with inaccuracies).

Sorry if this gives someone a calcII/numerical analysis flashback...I think it gave me one...

Now, for something a bit more useful. I downloaded connect...1.52. FTP'ed
off of atari.archive.

The archive is massively damaged when I recieved it. I was wondering if
anyone else has downloaded this program and has had the same problems...

>play stuff while I go and word process/ draw pictures/ play tetris :)
>or whatever at the same time.

Well, this should certainly be possible under MultiTOS, or perhaps under
MultiGEM, since the new version of Playback runs in a window.

For what it's worth, Playback has yielded a world-wide total of one (1)
shareware registration. This is pretty depressing, considering that it
certainly seems to be a program of some value (especially the new about-to-
be-released version), and arrangements have been made for both North American
and European shareware registration. Bah.

>You are right that, if sampling at exactly 70kHz, you cannot tell the
>difference between DC and 35kHz, but anything less than 35 is fine.

Well, he is right in a way. As you noted, at twice the target
frequency (exact) you are always hitting the same part of the wave - thus you
output a DC signal. If you sample at slightly more than twice target freq.
you start to get some distortions (obvious would be "beat" frequencies - the
difference in the frequencies is small enough that you can hear as samples
made along the target freq. differ only slightly and so your quasi-DC wave
varies at a frequency of (1/2 sample freq) - (target freq)). Other distortions
(as the original poster said) occur - and yes they do occur regularly on CD
(high frequency) sound. Its just that most music is an amalgum of lots and
lots of frequencies so you don't really notice much if a couple suffer from
phase/amplitude/whatever distortion as most of the bandwidth is faithfully
reproduced.

You might notice if you were sitting there listening to a single, solid
14kHz note (not something I do regularly) - this is about the point where
CD loses its frequency response (or maybe it was around 18KHz).

>According to your descriptions above, a CD should have a bandwidth of about
>10kHz or less!

See above. Its not quite that bad, but it certainly is not faithful
at 22.05KHz!

Yes, but the accessory version will cost 30 DM (~ $20), which is too much
compared to the 50 DM for Rufus or ConNect, where you get a complete
terminal program, and - in the latter case - a fine handbook written in TeX.

The author should consider in lowering the price to a considerable amount.
I won't pay 30 DM for that.

Thomas.

Source record: 217571

Are there any financial simulation-type games for the Atari ST?
I'm looking for something along the lines of:
"start with $10 and try to end up a millionaire in the stock market"

Mainly, I want to practice these kinds of things on the computer
until I can get some cash to play with in the real world.

It can be PD or commercial. (I heard Railway Tycoon is out...could
be interesting!)

I would appreciate e-mail, since I don't read this group very
often. If more than ten people requests it, I'll post a summary.

Kenny Yan.
The above is not a BNR view/comment/press release.

>using programs either from a.a or from purchased disks? Does this
>reflect the TOS version? Do you recommend an upgrade?

Robert, without a doubt, one of the most cost effective upgrades you can make to your ST is to buy a new TOS ROM set. Version 1.0 was particularly buggy in some areas and just plain slow in others. You can buy a set of version 1.4 ROMs from your "local" Atari dealer for about $60 for a vast improvement.

Much better is to install a set of TOS 2.06 ROMs which will give you the same desktop features as can be found on the MegaSTe and TT machines. The easiest way to do the latter is to purchase a TEC (TOS Extension Card) from the good folks at Codehead Technologies (213-386-5735) or ask your dealer for it.

If you are keeping your ST, definitely upgrade your TOS. It's well worth it!

I see the same double boot deal. It occurs when the reset-proof ramdisk starts up. Wow, I though I was the only one to have to deal with this. The ramdisk code that I use is one that I got from a magazine in 1987. I believe that it was Compute. I did patch the binary file to allow a greater than 1 Meg ramdisk. Many public domain ramdisks crash if you try to set up a 2 or 3 Meg RAM disk. The reason is not enough FAT sectors are allocated. I have a 4Meg 1040ST with 1 floppy drive and an EPROM drive that I made to hold compilers, editors and UNIX type tools. I have no hard disk so I use the ramdisk to hold lots of stuff.

Anyway, I too beleive that the double boot is due to the RAM disk code.

as mentionned before, there is the ATonce from Vortex

BTW: PC-speed isn't really supported any more

furthermore, both AT emulators come in 2 flavors:
one old running at 8Mhz and one a bit more recent running
at 16 Mhz (but without cache)

Both emulators are not identical, AT-speed C16 has
a math-copro socket while ATonce has a on-board RAM
possibility (up to 512K accessed at full speed)

There are other differences of course, but these are the
most obvious to me !

The defragmenters I'm familiar with all recommend strongly that you do a complete backup before using them. Then they take a long while moving clusters around. I recommend that you do a complete file-by-file backup (in contrast to an image-mode backup), verify it, clear out the disk partition and restore from the backup. You can even reformat if you like. This generates a defragmented partition with a current backup in about the same time as a defragger, and is more straightforward. I personally use Beckemeyer's Hard Disk Sentry too, but to spot problems and to generate a "write gap".

I would imagine you need to get lzh201i.lzh from atari.archive. I
posted a few weeks ago asking the same thing (about a different .lzh
file) and didn't get a single answer. In an email exchange on another
topic, somebody finally told me which one seems to be in widespread
use... I'm emailing you a uuencoded copy right after I post this, but
figured I'd post so that everybody else would know the answer, too.

If, in fact, lzh201i.lzh *isn't* the thing you want, I will say (in
its defense) that it worked for me on a number of .lzh files that
produced *BAD CRC* messages with unlzh172.prg...

Good luck...

In <197ongINN7mc@aludra.usc.edu>, Juxtaposer writes:

>>I do not think that you understand basic sampling theory. Please look it up.
>>A sine wave of up to 35kHz can be represented by a sampling rate of 70kHz.
>>You are right that, if sampling at exactly 70kHz, you cannot tell the
>>difference between DC and 35kHz, but anything less than 35 is fine.
>
> Well, he is right in a way. As you noted, at twice the target
>frequency (exact) you are always hitting the same part of the wave - thus you
>output a DC signal. If you sample at slightly more than twice target freq.

Not so! If sampling at exactly twice the target frequency, you will always
get a sample of one part, lets say positive part, and the next time you'll
get the other part (negative). This is when you rule out that you start
sampling at the time the target passes through zero. Another fault with
sampling at exactly twice the target frequency is that you cannot be sure
to get the right amplitude of the signal, although, the chance to get the
frequency is quite good.

The rest of the message i agree with, so I deleted it:)

I'm making no assumptions. I've got my degree in DSP and have made my living
using it for years.

>and yes, with the right sin/cosine
>waves you can _approximate_ a square/triangle wave. But a computer
>is on the other side - you have a machine that outputs what are basically
>square waves (no such thing as a true square wave as there is always some
>capacitance - and such a velocity would tear your speaker diaphram (sp?)).

A Fourier series is *not* an approximation. In a finite simulation of a
square wave based on a Fourier series indeed will have impulse spikes at
the transitions. True, you can use many waveforms as basis functions,
but complex sinusoids are the nicest to use mathematically. Anyway, one
doesn't actually create sounds in a DSP system by summing sinusoids;
it's a mathematical model used to explain how complex waveforms can be
created by summing simple basis functions. I was just trying to point
out that the highest frequency that can be represented by digitally
sampled data is a sine wave of half the sampling frequency. A Triangle
or square wave of half the sampling frequency contains many, many
complex frequencies which are all *higher* than the fundimental sine
frequency, and CANNOT be reconstructed from the sampled data.

>You are trying to approximate a sinusoidal wave with discrete method of
>continual samples - a more appropriate mathematical metaphor would be examining
>how a Gausian approximation works on a complex function. As delta->0 of
>the distance between gauge points of the function (these are the sampled

>function. As delta -> 0, your frequency -> infinity. Of course a computer
>cannot sample at infinite Hz...so you limit yourself to the frequency domain
>you wish to stay in (enter Nyquist, et all).

Ah, then you've heard of Nyquist? Remember, the highest frequency in
the reconstructed waveform is half the sampling rate? A sine wave, that
is, NOT a square or triangle wave which contain higher frequency

components.

>Of course there have been other
>means of improving on Gaussian approximation (the names escape me) - but they
>involve most of the techniques found in oversampling, and as such they are
>better left in the output functions, rather than in the raw data (where they
>would only make your data larger but with inaccuracies).
>
> Sorry if this gives someone a calcII/numerical analysis flashback...I
>think it gave me one...

I suppose if DSP systems used successive approximation your idea might
make some sort of sense. However, the way you reconstruct an analog
signal from digital samples is to run it through a low pass filter. It
also gets rid of those nasty alias frequencies that get folded over when
you perform a circular convolution.

Why am I trying to explain this...it's not intuitive or easily explained
without going into mathematical models, and you obviously aren't making
a real attempt to understand what's going on. There are lots of good
DSP texts around. If you'd really like to study this stuff send me some
e-mail and I'll give you some references.

Funny that both algorithms are IDENTICAL!!! Except for a few bugs left in the
LHarc source, of course. The increase in size you're seeing is the toc part,
which is compressed in lharc format, so that you have no chance at all to ever
figure out what's inside an archive if you're really in trouble.

>ZOO.TTP extract C:\ZOOFILE.ZOO F:\TEMP\

Try -extract (note the -)

>Personally, I'd rather use LZH, as I really hate waiting for things to
>compress. Uploading is a favour in most circumstances. Why trouble
>yourself with waiting longer, on top of the uploading time!? And
>then, if you can re-direct, copying files around!

Good for you. Unfortunately, a lot of people will then not be able to use
the stuff you uploaded without additional effort. Note that at home for
archiving purposes, I use lharc. I have never once used the "redirection"
feature. I have been angered countless times by the brain-damaged switches
for directory recursion that lharc has.

OrCAD for the PC is relatively unique. I don't think there is anything
comparable available even for the Macintosh, not to mention the Atari ST.

Someone please correct me if I'm wrong, as I know a Mac user who would love
to be able to run OrCAD.

What you've quoted Mr. Whitcomb as saying refers to the continuous
domain. There is no mention of discrete sampling.

>is on the other side - you have a machine that outputs what are basically
>square waves (no such thing as a true square wave as there is always some
>capacitance - and such a velocity would tear your speaker diaphram (sp?)).

All digital-to-analog converters must be followed by [analog] anti-aliasing
filters to eliminate the high frequency aliases in the "square wave" output.

>You are trying to approximate a sinusoidal wave with discrete method of
>continual samples - a more appropriate mathematical metaphor would be examining

ICD should have a package out now for US$50,- called SCSI Pro. This is a set of drivers for SCSI peripherals for MetaDOS (included). You can now hook up CD-ROM drives etc. if you have a SCSI adapter or a TT/Falcon. This was the impression I got when I called ICD last week. "It supports the whole SCSI roam", a tech guy named Howard said. Will I be able to hook up my coffee machine? Hmmm. I'll order this package. More info whenever I get it...

Does anyone know about a backup prog supporting a SCSI DAT streamer???

Excuse me, but if you sample a sine wave at twice its frequency you do
NOT hit the same part of the wave; you sample it at two points in its
cycle, 180 degrees apart. You won't get DC unless you hit both zero-
crossings.

[discussion of CD distortion at frequencies near 22.05kHz deleted]

High frequency distortion is primarily caused by the analog anti-
aliasing filters, which have to roll off very steeply at the cutoff
frequency.

One should not mistake real-world sampling artifacts for a limitation
of the ideal-world Sampling Theorem.

Nyquist rules! :-)

I have two. Neither has made me switch yet, but I'm thinking about it.

FILE TRANSFER WITH OTHER COMPUTERS:

Although the Atari ST is no slouch when it comes to emulating other
computers, the software needed to translate files from other computers
(word processing, graphics, database, spreadsheet, etc.) is much better
on the Macintosh. MacLink Plus now has over 700 translators available.

More importantly, the Mac can not only read and write IBM (& Atari) disks,
it can also read and write Apple II disks. This cannot be done on the ST
even with Spectre GCR. Since I have a number of friends with Apple II
computers, I find it very useful to have access to a real Mac so I can read
their Appleworks documents. (If I knew people with Commodore 64's I'd
probably be thinking about an Amiga for the same reason.)

THE LATEST PERIPHERALS:

You can shop around for the best CD-ROM drive, fax modem, full page scanner,
label printer, or whatever else they come up with next week. Installation
is easy--just insert the card into an empty slot in your PC (or plug it into
the AppleTalk connector) and run the installation program. Getting any of
this stuff to work on your ST is tough if you're not a hacker.

-George

2784. Glendale report

Newsgroup: comp.sys.atari.st
Date: 1992-09-16 23:17:05 UTC
From: Steven Gemma <sg47+@andrew.cmu.edu>
Message-ID: <lehw1lK00Voz05h14V@andrew.cmu.edu>
Source record: 217600

I haven't seen too much on this newsgroup about the Glendale show,
but I found this article from clari.nb.general.

I also just saw the director's cut of Blade Runner, and it's nice to be
reassured that Atari will still be around in 2019 :^)

Newsgroups: clari.nb.general
Subject: Atari Demos its Newest: the Falcon 09/15/92
From: newsbytes@clarinet.com
Date: 15 Sep 92 19:52:16 GMT

GLENDALE, CALIFORNIA, U.S.A., 1992 SEP 15 (NB) -- Atari
demonstrated the Falcon, its newly announced multimedia
computer, to small but enthusiastic crowds at the Atari Show
held this last weekend in the Glendale Civic Auditorium,
Glendale, California. Atari's biggest claim for the Falcon is
it is to bring "print-to-video" to the home user for less than
a total of $2,000.

The Falcon looks like the typical hook-up-to-your-television-
and-play-games computer, but Atari's Bill Rehbock, director of
applications software, had two Peripheral Land Incorporated
(PLI) 1.2 gigabyte portable hard disks connected via a small
computer systems interface (SCSI) II built into the falcon, as
well as a set of stereo speakers and two microphones -- items
your basic games computer couldn't handle.

The Falcon has a Motorola DSP 56001, a separate digital signal
processor (DSP) so the central processing unit (CPU), a
Motorola 68030, doesn't have to handle the processing of sound.
Atari pointed out that the only other two currently available
computers that come with a DSP are the Next and a Silicon
Graphics workstation. Rehbock demonstrated how the addition of
the DSP enables the Falcon to play sound without tying up the
CPU for other work by adding a 4-second audio sound to each
press of a key on the keyboard.

In fact, the audio capability of the Falcon enabled Rehbock to
record his voice saying the name of several letters of the
alphabet, like "A," and assigning the recording to the upper
and lower case versions of the corresponding keys on the
keyboard. He was then able to type at a normal speed, while the
Falcon played back in his voice, the letters he was typing.

Rehbock told Newsbytes any instrument that has an audio output,
such as an acoustic guitar or acoustic piano, can be connected

to the Falcon, and the output edited. The Falcon offers 50 kilohertz 16-bit sound. Voice tracks can also be laid over the instruments, so a musician can record all the parts in his own voice, put the instruments in and put the whole thing together himself, Rehbock added.

Rehbock demonstrated the Falcon on the SC1224, a color monitor released for the Atari ST computer in 1985. An annoying flicker in the screen image was present and the same annoying flicker would be present when the Falcon is connected to a television set because the Falcon is outputting video graphics array (VGA) quality display output, Atari said. The company is offering a $10 adapter so a standard VGA monitor can be connected to the Falcon, but wanted home users to be able to user whatever they already had. The flicker disappears during the display of video or games and is only present in the Atari user interface.

Atari said with software such as Chronos, Prism Paint, or a shareware program called Ray Shade, home users can "print to video" titles and computer generated animation on top of video. A video camera, a $120 adapter, and a video cassette recorder (VCR) are all that is necessary for a Falcon user to make their own titles and put animation over video or do special effects with still images, Rehbock told Newsbytes.

A $200 digitizer and third party software not yet available are required for editing of video images on the Falcon, but Rehbock said the Falcon is fully capable of processing such video images. The DSP also allows the processing of the images to be done independent of the CPU as well, Atari added.

Rehbock demonstrated to Newsbytes 16-bit True Color at 24 frames per second on the Falcon (broadcast quality is 30 frames per second). Atari says the capability is 320 by 200 pixel resolution and 32,768 colors, or 640 by 480 pixel resolution and 256 colors from a 264,144 color palette. Rehbock said the Falcon's DSP can decompress and display a 320 by 200 24-bit JPEG image in less than 1 second. JPEG compression is not built in and neither is MPEG, however, a slot for a processor to do real time MPEG compression is available on the Falcon and JPEG compression may be added as well, Atari said.

Two models of the Falcon will be offered at the end of October. A $799 model will offer 1 MB of memory and a single 3.5-inch disk drive. A $1,399 model will include 4 MB of memory and a 65 MB 2.5-inch IDE hard disk drive. Atari said the unit will support larger capacity internal drives, but only in the 2.5-inch form factor. It will support any size external drive via the SCSI II interface, Atari added.

Atari says it plans to demonstrate the video editing capability of the Falcon at Fall COMDEX in Las Vegas, Nevada in November,

though the company doesn't expect the software for video editing to be available until January or February of next year.

(Linda Rohrbough/19920914/Press Contact: Bill Rehbock, Atari, tel 408-745-2082, fax 408-745-2083)

Re: why is CD 44.1 kHz?

Stefan Monnier (sm86+@andrew.cmu.edu) wrote:
: Just a little question:
:
: is TV scan frequency 22.05, 14.7 or 11.025 Khz ?
:
: I mean, 44.1 Khz is NOT a multiple of horizontal scan frequency
: and I can't see any other relevant frequency in TV scan
: (vertical is much too low, dot bandwidth is much too high)

Here we go:

NTSC video at 59.94Hz has 35 blanked lines, leaving 490 lines. These
are interlaced, giving 245 lines per field. Three samples are stored
on each line.

So the sampling rate is:

59.94*245*3 = 44.0559 kHz

If you have 50Hz video, it's a bit easier:

50*294*3 = 44.1 kHZ.

AT-Once now has a 386SX emulator. Suggested retail price is $695.00
I'm sure most Atari dealers will discount this price to around $600.00

2789. Hard drive troubles (i think)

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 02:37:27 UTC
From: pinelr@aix.rpi.edu
Message-ID: <7q#z4jg@rpi.edu>
Source record: 217597

Hi everybody. Recently I've been getting the most curious errors on my Mega 2 with TOS 1.4. I have a ToadFile 44 removable hard drive (which is great I should say), but as of late, i seem to get 3 bombs across my screen at boot time. This occurs almost always when there is a system crash and I have to cold or warm boot the machine. It's really annoying to reset the machine and get 3 bombs. It must concern the hard drive, because it works fine with the HD turned off. The only way to remedy the problem is to power EVERYTHING down and start from scratch with the ICD disk in drive A:. Is this a disk cache problem? Hardware? Flakiness? I doubt it's the latter simply because it is reproducible on a consistent basis, but has only occurred in the past few days. Any help?

Thanks

2790. ATARI/IBM disk compatability, is it flawless?

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 02:54:50 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <168641342B.C556212@mizzou1.missouri.edu>
Source record: 217599

I have heard that there is a slight incompatability with IBM disks and Atari. Something along the lines of IBM using an extra sector for its FAT or something like that. Is this true, if so, is there one format (IBM or Atari) that I should use to guarantee better compatability?

Jeoff Hines c556212@mizzou1.missouri.edu

2791. Atari ST to STe DMA sound upgrade, does it exist?

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 02:59:33 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <1686413546.C556212@mizzou1.missouri.edu>
Source record: 217598

I love MODs. I love MIDI as well, which was my initial reason for
buying my ST (not to mention loyalty and knowing a good buy).
What I want now is to upgrade my 520ST to have the sound capabilities
of the STe without shelling out the money that us normal college students
don't have. Is there some kind of (compatable) upgrade out there? If so,
where could I get such a beast?
I don't know everything about the old tweety board, but what I
understood was that its for simple band-pass channeling and not a true
stereo sound, nor is it a replacement for the DMA.
Any information would be appreciated.
Thanks!
Jeoff Hines c556212@mizzou1.missouri.edu

I've got the ATonce Plus 286 board and it works quickly and so far flawlessly.
It's speed on my ST is roughly comparable to our IBM 386SX16 at work. I'm
very leased with it. Price is in the $350.00 to $400.00 range depending on
your source. As far as support is concerned I am fortunate enough to have an
Atari dealer locally(actually right next door) although I haven't really
required any assistance.

Hey! I used to have one of those. Other than being VERY slow and compatible with nothing at all (except raw ASCII) they also add an extra line feed to every carriage return and there is no way to turn it off. At least not that I could find. One other possible use might be as a doorstop since it's not heavy enough to anchor your boat. No flame intended here, just my own personal observation.

Hi friends,

I'd like to get the ghostscript binaries for the ST. I have tried several times to get it from atari.archive, but with no success. I keep getting an error message ' no such file or directory '. The file I was trying to get is gs23b.zoo, located in atari/printing -or- atari/gnustuff/tos/ghostscript. If anyone would be willing to send me this archive, or clue me in as to why I can't seem to get it, I would apprecciate it.

BTW, I do not have direct FTP access so I use the mail server or the ftp server at decwrl (I prefer to use this, because it send back error messages instead of just no reply when I make a mistake).

Thanks,
Doug Sr.

Source record: 217362

Hi guys,

I've tried to install the famous EMACS 18.58 on my ATARI MEGAST2 under TOS1.04.
I felt in trouble with this due to an error message :Fatal error (14).
What is this? Not enough memory (->MEGAST2).
I've used MUPFEL out of the GEMINI package and set up all described ENV's
in ST-EMACS.TEX.
Without these ENV's I got som message out of EMACS, relating to TERMCAP
and TERM ENV's.
The EMACS 18.58 binary are from the EMACSBIN.ZOO file from archive.???.ruu.nl
(just forget the exact name of the server).

I've to re-install TEMACS with FIXSKT and DUMPEMCS??? Or is emacs running only
under MiNT??

Waiting for any help

> Konrad Hinsen (hac041@zam001.zam.kfa-juelich.de)

As far as I know, there *not* many versions of ZOO 2.1 around (as apposed to LHARC :-)), but only two. One version was ported by Bill Shroka and compiled with GCC and the respective libs. This version understands the UNIXMODE env variable. I believe, this is the version, that most people in the net community use (at least outside Germany). This version should be available from the atari archive at terminator.

The other version was ported by Gereon Steffens (coauthor of Gemini) and uses TURBO C (now Pure C). This version doesn't understand UNIXMODE, of course. I think, this version only well known in the local mailbox scene here in Germany.

Message-ID: <1992Sep17.035454.20776@hemlock.cray.com>
Source record: 217364

The .tfm file isn't produced, because Metafont thinks it's in proffing mode.
You can tell this, because the size of the font was 2606 (or something close!).
You need to tell Metafont that you actually wish to create fonts for a
particular device; then it will give you a sensibly-scaled .gf file and a .tfm
file. From memory, you need to say something like:

```
virmf \&cmplain '\mode:=canon; mag:=magstep(0); input fontname.mf'
```

This would produce (I hope!) fontname.300gf and fontname.mf. You then use
gftopk to create fontname.300pk:

```
gftopk fontname.300gf
```

Hope this helps! Apologies if my memory is failing me -- it won't be the first
time ;-)

Cheers,

[M][a][r][c]

Wouldn't it be nice if they had a UK distribution point. As the UK is not very well networked, a download system would be more expensive than sending a disk to the states and getting it sent back. Maybe ICD should get one of the PD software libraries to carry it. This would cost people a lot less. I would suggest someone like Floppyshop.

What do other people think?

DD formats are not exactly the same as on IBM compatibles but they are fully
compatible as long as you have formatted you disk with TOS 1.04 or higher
(or on an IBM compatible, of course).

2807. European Software for the Falcon?

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 11:14:37 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.716728477@garbod20>
Source record: 217369

I'm wondering if there are European software houses that have already started working on games, applications, etc for the Falcon computer.

I remember Psygnosis did some early but very impressive games for the Atari ST/Commodore Amiga computers in the mid-80s, long before these 68000 home computers had a significant market share (in Europe).

Other companies, like Ocean, waited for an established user base to grow before they started releasing games.

I hope Atari will succeed in launching the new product in important markets like the UK and Germany.

You forgot one important thing, the ICD software is not PD..

To get the latest upgrade it will cost you $10us, plus you must mail your
disk back to them..

Or if you have a V32bis modem you could dnload it from there BBS...

And if you know how, its posible to call GEnie Free from the U.K.

This line that I use here, (pacnet) is completly free, GEnie have a node here,
but I do pay $8us per hour for my connect time on GEnie..

Mind you we still have free local phone calls here, well untill ma bell
decides to change it all...

Hmmmmm, might be a bit embarassing if you get some paint spots on your
monitor. And if I tape it the thing will have tape glue on it. So it
really isn't as simple as that.
But what I really would like to see, is a Falcon in Atari BLUE! With
white letters and other accessories. Then we can really have almost the
power of a Iris Indigo with a color that is even better looking!

>The SH204 with its original ST-225 works fine.

The ICD software should be able to handle it. I tried a 80 MB seagate +
204 host adapter and it worked fine. (Of course you need an ICD adapter
'somewhere' at your dma port. But perhaps you can ask someone to format
your drive with ICD. Then any hard disc driver shold do)

>
> i'd like to see what this thing can do.
>
> thanks..

Well, as a start : This program came up on an ST-Format disk during the
summer.
It was made (I seem to recall) to display images from a full color
Raytracer
called qrt, which is at the a.a. in the graphics directory.

This qrt creates images with 16 mill colors in a simple format called
RAW.
Well, what you are about to do is :

Wait until some kind soul uploads some pictures to a.a. I myself cannot
do this
before mid-october, so I hope someone else can do it.

If you get the program to work, which it is supposed to, with IFF
pictures, watch them
but be beware, you'll "only" get 4096 colors on screen (with STE).

Run qrt on the files included in the release, which you better do at
night.
Even better : Get the sources for Qrt (Amiga) and compile them so it can
accept
batch jobs, it's slooooooow....

Jarle.

It's archived in -lh5- format, which can't be handled by unlzh172. You need
one of Questor's lharc programs, such as lzh201j.ttp.

On my PC at work, a defragmenter helps every so often (it does increase
the disk access a little), but you have to remember, I'm running
Windows on it, so there's temporary files galore...

On my ST, I do one thing to help avoid the need for too many read/writes
to my hard drive - when I download a file, I download it to my ramdisk
(usually around a 1.5 meg ramdisk). And I do ALL my archiving on the
ramdisk (so all the read/writes go there). Then, I just copy the
archived file to my e:\backups directory, and the unarchived version
(if I want to use it) to it's appropriate place on my hard drive.
That way, minimal use of the hard drive (besides, it's a whole lot faster
on a ramdisk anyways)...

>observation.

Actually it is possible to change the DMP105's handling of line
separators, but it's not dip-switch settable--you'll have to send it
the appropriate commands each time you turn it on (or get your word
processor or whatever to do it). Consult your manual, or email me if
you don't have one. The DMP105 was the first printer I ever owned
(well, not counting the little thermal job I had for my Sinclair
ZX81). My wife still uses it for quick (?! :-) drafts of stuff she's
working on in WordPerfect. Granted it's slow, but it works OK for
text printing (including bold and underlining; you can even manage
super/subscripts if your word processor has editable character
tables), and it has been very reliable.

(Yes, I still have the ZX81 printer too. I just can't bring myself to
throw old toys away. :-)

If you have problems using the same floppies on both IBM and Atari computers,
one of the safest bets is to format the floppies on the IBM first. There are
also several commercial and shareware disk formatting utilities for the ST that
write the IBM boot sector on the disk when formatting it.

Yes - and the topic was on sampling. Someone posted about getting
a DC wave at twice target freq. and triangle/square waves at 4 times the
sample rate. Mr. Whitcomb through in some nice continuous-domain comments
and I, thinking he was on the wrong track, was trying to show him why it
was not applicable to the discussion, being as it dealt in the continuous
domain (but I am rather long winded at times).

[more of my drivel deleted]

>All digital-to-analog converters must be followed by [analog] anti-aliasing

>made along the target freq. differ only slightly and so your quasi-DC wave
>varies at a frequency of (1/2 sample freq) - (target freq)).

Please take David's advice and learn more about sampling theory.
The output of a digital-to-analog converter and reconstruction filter does
not correspond to what you ``eyeball'' the sampled wave to look like.
Nyquist's theory states that a perfectly bandlimited signal, when sampled at
more than twice its frequency content, can be *exactly* reconstructed by a
specific process involving D/A converters and appropriate filters. Any
failing in perfect reconstruction is not due to the sampling process or the
sampling rate itself, but to limitations in the physical implementations of
the sample/holds, A/D, D/A, and filters. (Actually, the sampling rate
theory does not deal with signal quantization to a certain number of bits,
but that does not seem to be the basic misunderstanding here.)

A couple of weeks ago, somebody posted a list of
required files to run GCC v2.1. Since then, I have
lost the file. Could somebody please mail me a copy
of the GCC required files. Alternatively, I seem to
have GCC compiling hello.c sucessfully up to the linker.
The linker appears to be looking for a library file,
and I dont seem to have one (that is, I dont have
a libc.a or equivalent. Would somebody who knows what
they are doing care to comment

Thanks for the help,

Andy

2827. Starjet SJ-48; laser/inkjet help!!!

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 19:45:55 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1992Sep17.154555.1@sscl.uwo.ca>
Source record: 217392

Hi peoples! Has anyone any knowledge of the STARJET SJ-48 bubble-jet printer? I was thinking of acquiring a new computer and possibly a better printer...especially since I can't find a Calamus 24pin printer driver!!! I think laser is out of my range but inkjets and bubblejets seem reasonable. The Starjet LOOKS identical to the Canon BJ10e (except it's grey). The BJ10e seems as though it's becoming quite well supported. Does anyone know if the Starjet could be run with a 10e driver? Has anyone used a Starjet (by Star, by the way...pretty obvious, eh!) Any help with the Starjet, or comments/reviews of inkjets and lasers would be appreciated...thanks!

p.s. If anyone knows of a 24pin driver for calamus I would appreciate some help with that also. I wrote to the Calamus folks but haven't heard back yet. Is there an e-mail address for these folks?

2828. .CPT archiving, what is it?

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 20:05:07 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <16865D423.C556212@mizzou1.missouri.edu>
Source record: 217393

I just got a collection of what I believe to be classical .MODs, but
there is a catch to this wonderful suprise, the file seems to be compacted
or at least archived. The extension is .CPT. The area I found it was
APPLE II GS. (are they still around?). Anyways, I would appreciate any
leads someone could give me as to how to un-CPT this thing so I can
check it out.....
Thanks!
Jeoff Hines c556212@mizzou1.missouri.edu

2829. Can I re-partition HD without backing it up?

Newsgroup: comp.sys.atari.st
Date: 1992-09-17 20:09:48 UTC
From: C556212@mizzou1.missouri.edu
Message-ID: <16865D53C.C556212@mizzou1.missouri.edu>

I second the recommendation. I've used Diamond Edge for a little while now.
It is fast, easy to use, and has found (and fixed) problems on my disk
that other commercial software did not find.

And - there's nothing like a defragged AUTO folder to make booting go fast!

Whoops. As you (and others!) pointed out, you do get the right freq.
(unless you get it at amplitude zero), but that amplitude is messed up. This
brought up a question in my mind that I hope someone familiar with the DMA
sound capabilities of the ST line can answer.

As was noted, you can output your highest frequency as either a sine
wave or as a sort of step-function ouput (which at the highest frequency
would become a triangle wave). Does DMA sound get output as a sine or as
a step (as close as capacitance allows) function?

In other words, if you were to look at an analysis of the DMA's highest
output sound, would it look like a nice sinusoidal wave or would it look
blocky/triangular?

>The rest of the message i agree with, so I deleted it:)

I'm glad someone did. :)

>

If you'll use DOS formatted Disks you'll get less problems but you
cannot format your DOS disks with 10 sectors, can you?
So you'll lose about 60KByte or more per disk...

Well whether the Falcon is worth buying or not, I've just seen an
advert for one! Mind you I doubt if they actual have any in stock.
Price about 475 pounds for minimum configuration. One of the UK mags claims
that Atari UK are shipping in 10,000 units this October into the UK.
Whether it's true or not is another matter.

```

Eurpean software for the Falcon is in the making already. Eclipse is working on a 3-D Elite type of game for it. Jeff Minter who made "revenge of the mutant spacecamels" and "Defender" etc. is working on an Defender type of game. Overscan is working on programs for it. If I�m not mistaking, I belive it�s around 200 developers working on programs for it in addition to the Atari developers. John Scruch, head of Atari developer department told me at de Atari Messe in Dusseldorf that at least 5 or 6 great games will be ready for the Falcon before Christmas. I belive the number will be slightly higher.

I to hope Falcon will be a sucsess and belive it will. According to pretty reliable sources Atari has about $ 360 millions in the bank to push the Falcon into the market. Their strategy is to take on the market in the U.S state by state and satisfy the demand before they continue to the next state. In Europe they will do almost the same. They�ll take on Germany and England first and then on to Scandinavia. By the way a big firm with a LOT of money is going to take over the import and distribution in Scandinavia. The name of the firm is not known to me at this time and therfore i don�t know in which country it�s based.

Another thing... Amiga is selling very little these days. At least thats what I�ve heard. A600 is a flop in England due to it�s incompability towards some old A500 software and that you need an extra chip from commodore to connect an internal IDE-harddisk to it. That chip is not available here in Norway yet. Way to go Commodore.

By the way Commodore has no machine to match Falcon. They have launched A4000, but it sucks.

Rune Hyldmo

For all I know, *.CPT archives are generated and extracted by the Mac archiver called compactor. Anyone who has a Spectre should be able to deal with those archives, since compactor is on the Mac PD disk included with Spectre 3.0 (that's where I know compactor and the *.CPT archives from). Unfortunately, I don't know if any Atari archiver can deal with *.CPT archives.

2842. Re: Photo Chrome - uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 16:34:31 UTC
From: baffoni@aludra.usc.edu
Message-ID: <19d0enINN1qc@aludra.usc.edu>
Source record: 217454

The question I have about this program is - Is it TT compatible?
This would be pretty neat software to run in TT modes (ie - if it could
do its tricks in TTmed so you get the awesome colors etc. in a 640x480
screen). I suspect it has a LOT of assembly with tight timing loops and
thus is not likely to work, but if someone out there has tried it, PLEASE
POST YOUR RESULTS!

-Mike

2844. MicroEMACS 3.11c-beta1.1 available

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 17:31:10 UTC
From: POHLERB@DMSWWU1A.UNI-MUENSTER.DE
Message-ID: <92262.161120POHLERB@DMSWWU1A.UNI-MUENSTER.DE>
Source record: 217457

A new version of my port of MicroEMACS for ST(E)/TT computers is now
available. In this version several bugs have been fixed. Please get
rid of older versions and please do not give them away any longer!

The following files are available at ftp.uni-muenster.de in the
folder /pub/atari/editors/microemacs3.11c-b1.1 :

length file description
==
58268 ue311cmd.zoo Macros and startup-file; get this archive!
73389 ue311doc.zoo Documentation for MicroEMACS 3.11 This file has
not changed since the last release.
64947 ue311gbw.zoo GEM-MicroEMACS, monochrome version (executable)
65471 ue311gcl.zoo GEM-MicroEMACS, color version (executable)
57344 ue311st.zoo A hacked version with linea-calls. I do not use it!
(executable)
66775 ue311tc.zoo A TERMCAP-based version of MicroEMACS (executable)

I also uploaded the files to atari.archive.umich.edu, so please first
look there, if you're outside of Europe. Thanks! The files are
currently in atari/new/me3.11-b1.1

In this version, programmable GEM-menus have been added to
GEM-MicroEMACS. As the menu is quite large, GEM-MicroEMACS might have
problems in the low resolution (I did not test it).
The executable in ue3.11st.zoo might have problems with some
configuration as it uses undocumented features of TOS.
Exept for these two cases, MicroEMACS should run under any
configuration. If not, or if you find other bugs, please mail them
to

2845. When Can I Buy The Falcon ?

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 17:41:02 UTC
From: mikhil@Vaduz.docs.uu.se
Message-ID: <mikhil.716838062@Vaduz>
Source record: 217459

I have followed the discussion about the Falcon
on the net. There's a lot of talk about this
wonderful/miserable (choose one) machine. However
no one has said anything about when and where I
can buy the machine. I'm beginning to think that
Atari will never release it, or if they do it will
be too late because some other company has developed
a much more powerful machine at an even more affordable
price. So Ataricorporation or anyone else who knows:

WHEN WILL THE FALCON BE AVAILABLE IN THE STORES ?????
(I'm thinking of the stores in Sweden (Scandinavia),
Germany or England)

Mikael Hillborg
Computer science student at the
University Of Uppsala, Sweden

If you don't mind, I'd like to rip some of these arguments :).

In article <997@dgaust.dg.oz> brown@dgaust.dg.oz (Fred Brown) writes:
>GRAPHICS DISPLAYS: IBM has VGA & svga graphics, not to mention the
>amount of colours that can be displayed on the screen at one time.
>My MegaSTE 4mb can ONLY display 2 colours at high res, 4 on medium
>& a paltry 16 on low res.

Um, you do realize that there are graphics cards out for the MegaSTE
that are _much_ better than base STE modes, and even rival IBM cards of the
same price, right? Remember, an IBM without a graphics card is unusable
(except as a server). An ST (or STE/TT) is usable without a card, it just
isnt necessarily pretty.

Oh, and since the subject-line includes Mac, even though it was never
quoted in the reasons, for completeness: Again, you get what you pay for -
if you just go with stock video, you get 256 colors (or less) on a 13" (or
less) monitor - you have to buy a (expensive, IMO) graphics card to improve
on this.

On both machines, the high-ends are better than are currently available
for the ST/STE/TT, but then we aren't talking high-end here.

>ACCESSORIES: Hard disks, floppy disks, SIMMS etc. are a lot cheaper
>for the IBM

This is funny. You do realize that the STE can use the exact same
SIMMs as the IBM? Well, perhaps not PS/2 SIMMs (funny beasties those...),
but it certainly can use IBM clone SIMMs - and can even use (gasp!) cheaper
SIMMs without that 9th bit, or even slower SIMMs (I don't believe the MSTE
has any problem with slower-than-80ns without waitstates, but I could be
wrong on that part - but it can use them anyway).

For the IBM, if you are connecting to the ACSI port on the back
of the machine, prices should only differ by an amount equal to the price of
the host adapter (but then, you need a HD card -gee, forgot about that
expense? So make that difference=hostadapter-card). If you are connecting to
the internal SCSI port, all you need is the drive (possibly not needing the
case either).

For the Mac, you don't need much so the host adapter again is the
only difference in price. However, you can use any HD the Mac can use.
You can also use the same SIMMs as the mac uses (except for the MacIIfx,
which are expensive anyway).

>SUPPORT: The Atari ST is very poorly supportedm& promoted here in
>Australia.

Can't argue with that. Not because I don't believe you (I do), but
because a) they don't market them very well here (in US) and more importantly
b) since I don't live there, I am hardly qualified to say what they are or
are not doing to get Atari in the public eye.

>PRICE: The MEGASTE 4MB without a monitor sells for A$2,795.00 here
>in Australia, my IBM clone 386SX 25Mhz @2mb Ram 40mb Hdd 1.44 fdd
>without a monitor cost me only $1,198.00 and that was over 6 months
>ago, prices have come down since then on clones.
>Anyway thats my whinge for the day...

Haven't the price cuts hit in Australia? I've heard that prices are
being slashed on everything from the TT down, due to the imminent release of
the Falcon. Even though prices have come down on PCs, they aren't likely
to come down much more as everyone has reduced down to as low a profit margin
as they can without going out of business - and some have done just that.
Unfortunately (for you), it sounds like this disparity of system price is
due to yoru Geographical location. In the US (pulling out a copy of PC WEEK)
clones with your config above run about $1195, but the MSTE is no where near
the 2,795 you quoted (lets put aside exchange rates for now, as we are talking
relative prices). From memory, MSTE prices are around $1200 (before the price
cuts) from my local dealer (1MB,1.44,65MB HD, monitor) - less if you don't need
the monitor, more if you want more memory, etc.

A MacLCII with 4MB/40MB, monitor(12"RGB), keyboard/mouse will run
(with educational discount) about $1800 - base is 1300, monitor 400, keyboard
is 89.

Of course, in this discussion, no mention of the Falcon was made, but
should it come out in October for $799/$1399...well, you can draw your own
conclusions (you will anyway :) .

2848. Re: Ghostscript 2.4.1 for TT

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 19:17:16 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1992Sep18.121720.3721@arizona.edu>
Source record: 217463

I downloaded Ghostscript 2.4.1 compiled for the TT from Stuttgart yesterday, and it works (about 30% faster on the couple files I timed) except that after pressing RETURN after the >>showpage<< message, I get an endless stream of errors instead of the gs command line. I have to do a ^C to get out (back to Gulam). Had anyone else had these problems? I don't know who posted it, so I can't get back to him.

2849. Higher-rez on a TT???

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 19:24:01 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1992Sep18.122402.3723@arizona.edu>
Source record: 217464

When using a TT with a PTC1435 (or whatever number it is--the color one) monitor, the switch on the back is set to TTL. When the switch is set to VGA, the regular display becomes narrower, about 2/3 of the screen. But then, the background color fills in the whole screen, instead of going off the sides. I have some program (I forget what) that causes random colors to appear in these side-regions, so I was wondering, is there some way to actually be able to use these side areas (and leave the switch on VGA) just with software? I've wondered this for a long time and have never heard anything about it.

2850. elvis 1.5 and fmt

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 19:44:24 UTC
From: eugene@cs.athabascau.ca
Message-ID: <2403@aupair.cs.athabascau.ca>
Source record: 217466

I recently downloaded ELVIS 1.5 (a vi-like editor) from the umich atari archives. Supposedly, the program "fmt" was bundled with elvis, but when I unpacked the file, "fmt" was missing. "fmt" is a simple PD formatting utility which aligns text to a preset right hand margin.

I have the source code for "fmt", but have been unable to compile it. Does anyone have the atari binaries for this program or at least know where I can get them? I would really appreciate receiving the program. Thanks,

Gene Rubin

2851. Printing on a 2M TT with slm804

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 20:18:00 UTC
From: alewis@vx9000.weber.edu
Message-ID: <18SEP199213183356@vx9000.weber.edu>
Source record: 217461

I sold my Mega 4 and got a TT and can't get anything to print on my slm804 printer, either because of not enough memory, or the diablo emulator doesn't see the printer while everthing else does, or Ultrascript doesn't work.

CS-Tex prints out blank pages, probably because of memory. I will buy memory especially since the prices went down recently, but I can't for several months yet, so I'm tyring to find and intermediate solution. Any ideas?

Mikael, your guess is probably as good as the next, but the "word" from Atari is that shipments have already begun to Europe (?) and they should be available in stores sometime in October. Personally, I find that to be a little optimistic but you should check with your dealers there for their most current info.

As usual, we US based Atarians will once again play the waiting game. <sigh>

2853. MiNT questions

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 20:25:00 UTC
From: alewis@vx9000.weber.edu
Message-ID: <18SEP199213253725@vx9000.weber.edu>
Source record: 217462

I understand you can only have one GEM program running under MiNT at a time, so are there programs like a general modem program that is TOS and will work with MiNT? I would like to be able to use a terminal program in the background and say the desktop or PageStream. Could I for example be using PageStream and open a cli and editor to compile with gcc at the same time?

What are the must have programs to use with MiNT, i.e. what is the best cli, editor, compilers, etc. that work with MiNT?

What do most people who use MiNT use it for?

Thanks.

2854. Re: .CPT archiving, what is it?

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 22:13:59 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Sep18.221359.27631@actrix.gen.nz>
Source record: 217472

.CPT files are created with a program called 'Compact Pro' on the Mac/Apple. Basically, it's a self-extracting .SIT file, so if you can find UNSIT for the ST (It's on atari.archive.umich.edu FTP site I think), then you should be able to extract it.

This are the newest version of the ICD-Software:

COPYFIX Version 1.5
HDUTIL Version 4.12
ICDFMT Version 5.18
ICDBOOT Version 5.6.1
HDPARK Version 2.02
ICDTIME Version 2.0
TIMESET Version 1.5
COLDBOOT Version 2.01
CFGCBOOT Version 2.02
HDPARTS Version 2.04
CACHEOFF Version 1.2
CACHEON Version 1.2
CLEANUP Version 4.21
IDCHECK Version 2.04
RATEHD Version 2.06
WO_IST Version 1.81
CACHEHIT Version 1.12
HOST Version 2.02
BOOTFIX Version 2.10
DESKTOP Version 3.09
ADSCSI Version 1.00

You can get them from your nearest ICD-Software Box...

Bye,
Wolfgang.

>can't seem to keep a ball active for more than a second...
> Any hints, help, info etc appreciated!
>------------------
>J.J. Lehett : Atari's, puzzles, games, chaos, fractals, math....
>

You have to find equal "memory"-stones (that are the black stones - if you
touch one with your mouse it opens a symbol. if you find the other one this
two stones left open - if not the first one will close and you have to find
the other one of the second...)
There are several "problems" like breaking through a floor (if you are too
slow or cross one point several times), ice (very slippy), killing-stones,
etc. Beware of leaving the floor (fall down into the black holes)....

Just try it...

Bye,
Wolfgang.

2858. Crack Art (posting from the authors)

Newsgroup: comp.sys.atari.st
Date: 1992-09-18 22:33:03 UTC
From: BWWL@ibm.rz.tu-clausthal.de
Message-ID: <1686614B30.BWWL@ibm.rz.tu-clausthal.de>
Source record: 217471

Hello!

This is a posting from Detlef Roettger and Jan Borchers (the authors
of Crack Art). Sorry for the english....

If you have never heard about Crack Art before, read at least the
additional words at the end of this letter, please.

Detlef Roettger Jan Borchers
Vienenburger Str. 27 Vititorwall 10
W-3387 Vienenburg 2 W-3380 Goslar
Germany Germany

Tel.: (+49) 05324/6452 Tel./Fax.(G3): (+49) 05321/43998

Subject: ATARI-Shareware

Product: CRACK ART Version 1.32 TT+ (18.09.1992)

This message is addressed to all users of e-mail and FTP.

We (the programmer of Crack Art) are pleased about the great interest in
out program. We write to all unregistered users of Crack Art. The newest
version is 1.32 TT+ is now ready. All other version less than 1.30 TT+ are
absolutly out of date. (1.32 TT+ is the less buggiest version ;-))

All user (programmer?) who do not have the complete Crack Art package (yes,
it is more than only one program!), but want to have the >650 kByte of
programs, docs, listings, sources, inlines, games, printer-driver etc.
should contact us.

We think you won't miss this program - if you have tried it once. This is
not only our opinion but also at least two other well known Atari-magazins:
The english magazine ST-Format has given 94% to Crack Art 1.00 TT+,
'ST-Format Gold Award' (best shareware graphic-program), the german
ST-MAGAZIN (Markt&Technik Verlag) will present an article in the issue
of october 1992 (in colour of course!) about version 1.20 TT+. We don't
know the article right now, but we are sure it isn't bad...

Always remind: The newest version is only obtainable from the authors.
So register yourself! The shareware-fee of version 1.32 TT+ is 30,- DM
(german mark). We will send you the newest version of Crack Art and a
personal thanks as soon as possible. Inquiries can be made via "normal"-
mail or via FAX (G3 standart) to one of the addresses above.
Since most user (reading this) are using electronic-mail your questions
won't reach us (because we do not have an account on any host). If you

want further versions of Crack Art released as Shareware you have to support this - very fair - concept. If (even after this posting) there is no feedback from FTP-users, further versions won't be on any servers...

All questions about 'shareware only in germany' are very happy - since the first registrations reached us from england, france and canada! Germany is now getting better...

Crack Art will not be released in a '4096 colour STE/TT' version, because therefor an extra-version will be neccessary. The effort to create an extra-versions if not known (at the moment)...

Absolutly utopian is a re-programming to 640*480 TT mode. We could start complete new...

Crack Art doesn't run on the Falcon. There are problems with the fillstyles and with the mouse (this kind of problem affects also the users of NVDI 2.0x). We are writing a new mouse-routine to work around this problem...

The facility to grab graphics out of other programs is now much better (because of the new BOOTDUMP-sector created be Crack Art formatting). Besides such a disc will help you if something goes *really* wrong while working with Crack Art. After a crash of crackart you can still reboot and save the pictures you normally loss... What other program supports that?

There was a special Crack Art 'scannerversion'. This special version was NOT shareware. Because of the new, flexible drivers this has changed. The Crack Art program is always shareware - only the scanner-driver is NOT. The included scanner-interface (CAS-file) only calls this driver. If the driver isn't loaded nothing would happen.

There are many ways to expand Crack Art. The exact ways are shown in the documentation. You can use Assembler-routines or you can use the printer ans scanner-drivers. Also it is possible to access Crack Art via the SCRAP-buffer (see docs about ACCESSORIES). You can use any language to program special extension. Such programs can be loaded by Crack Art (*.PRG, *.TOS). If you have programmed extensions like this: Please send us the programs (so we are able to include them in further packages). (There was a competition about DEGAS Elite modules. Perhaps we could try something like this...)

We hope for a better shareware-feedback. You can read another article in ST-Magazin (at the latest 24.09.1992). Perhaps this could convince you of taking the (already written) register-mail from your desktop and send is to us. (you may send a cheque instead of money - if you want).

Happy hacking and drawing,
Jan & Detlef

---

some additional words:

the english version of the manual is under construction. please be
patient. (the buttons etc. are english, so the usage of Crack Art
should be very hard... try the functions keys, both mouse keys, the
SHIFT, ALTERNATE, CONTROL keys in conjunction with the mouse keys....)

if you want to get the new version of Crack Art via FTP:
- send the shareware fee to the authors
- you will get the IP-Number and the (FTP-)login name of a host to
receive the newest version (at the moment 1.32 TT+)
- this is an additonal service. of course you can get the disc directly
from the authors....

if you have never heard about Crack Art:
- you can get the older version of Crack Art (V1.00 TT+) normally via
FTP from:
atari.archive.umich.edu (141.211.164.8) atari/grpahics/crackart.lzh
sun.rz.tu-clausthal.de (139.174.1.3) /pub/atari/graphics/painter/crackart.lzh

Bye,
Wolfgang.

>going to live on it is going to have to do this.

Well, part of the campaign is to let Atari know what YOU and other
dealerships think they need to do to help you sell more computers.

If we compile a list of a dozen dealers with similar suggestions,
the company MAY listen.

It may work, maybe not, but we don't have much to lose except a
few stamps.

Atari has some type of co-op deal where they share the cost of
advertising with dealers. Have you ever advertised with Atari?
If not, why? What was the problem? This is the type of stuff that
we are looking for.

Don't EVEN think about doing that without doing a backup first, if your
data is valuable to you... You'll lose EVERYTHING on those partitions.

To make it easy on yourself, find a second mech and just file copy things
over to that one first, instead of doing copies to a gabillion floppies.

It seems you're talking about overscan !
I know there is an overscan extension board for TT (as well
as for ST), but I don't know how to get it in the USA

Has anyone infos about it ?

I think you can. There is an argument when calling format
on PCs which indicate the number of sectors per track.
As I always used it with 9 sectors, I don't know whether it
accepts 10. Just try !

it's something like: C:> format /N9 b:
(but check in a man page)

Seriously, do you think they will sell a consumer product
with compiler and development tools ??

Some will surely be available, but separately, as usual !

>see the printer while everthing else does, or Ultrascript doesn't work.

Have you installed the diablo driver that came along with the TT, or are you
just using your old setup?
Have you tried to reduce the number of fonts?

2867. STM_BBOT bootselector

Newsgroup: comp.sys.atari.st
Date: 1992-09-19 11:45:56 UTC
From: BWWL@ibm.rz.tu-clausthal.de
Message-ID: <16867B384.BWWL@ibm.rz.tu-clausthal.de>
Source record: 217482

Hello!

A few days (weeks?) ago I posted a statement about bootselectors. The one
I use is now available via FTP from sun.rz.tu-clausthal.de (139.174.1.3)
/pub/atari/systools/boot/stm_boot.lzh

Bye,
Wolfgang.

2868. Re: When Can I Buy The Falcon ?

Newsgroup: comp.sys.atari.st
Date: 1992-09-19 12:12:50 UTC
From: mikhil@ida.csd.uu.se
Message-ID: <mikhil.716904770@ida>
Source record: 217478

If the shipments of Falcons to Europe has begun does anyone
know which type of software (if any) comes with the machine ?
Does it like the next-machines include compiler(s) and software-
development environment(s) or is it shipped with no software
at all ? Only demos ? Only games ?
I am a computerscience student interested and involved in computermusic
(software development as well as performance) and would be *very*
interested (=extremely interested) if the machine is shipped with a
reliable and well-designed C or C++-programmingenvironment supporting
the superb audio hardware of the Falcon. If not I think it is important
for Atari at least to be sure that some software developing company will
design such an environment as fast as possible. It's important that a
well designed high-level programming environment exists. Otherwise no-
one will be interested in writing software for it. Look at Borland's
C++ for windows. It's lovely. Viewing inheritancestructures is instant
and a pice-of-a-cake and the debugger is perfect. I want to see this
kind of environments for the Falcon, it's the least you could demand.
The audiospecs are *very* interesting. I can imagine many audio-
applications I would definitely write for the machine if it will
be available in some reasonable time for a reasonably price.

I hope this is the start of cheap (relative to todays megabuck)
musiccomputers which sync midirecordings with digital recordings of
acoustic tracks. Wouldn't it be nice to copy and paste an acoustic
guitar- or vocaltrack at the same time as you are cutting and pasting
sections of midi-data.

2873. More on installing emacs18.55

Newsgroup: comp.sys.atari.st
Date: 1992-09-19 15:31:48 UTC
From: piet@cs.ruu.nl
Message-ID: <1992Sep19.153148.27022@cs.ruu.nl>
Source record: 217481

I tried to install emacs 18.55 on my ST today and found the following:

As somebody else suggested the dumping did not succeed until I renamed the e-lisp directory to lisp, e-bin to bin and e-etc to etc. Of course this sounds strange. I suspect that there is a finite buffer somewhere for these file names that overflows if your filenames are too long. I used /dev/F/emacs/xxx and the original names in temacs are /usr/lib/GNU/xxx, so try to keep your file names shorter than that.

secondly, the documentation says to set the environment variable EMACSETC. I found that you have to set EMACSDOC instead.

Third, if you do not have enough diskspace, no warning will be given. If you run out of diskspace while dumping xemacs.2, the dumping process might hang and you will have to reboot. If it runs out while making emacs.ttp, you will get an invalid emacs.ttp, again without a warning. So check your diskspace after the dumping.

The choice of the EMACSLOADPATH and EMACSLIB environment variable for the dumping is rather unfortunate. Standard for emacs is that EMACSLOADPATH gives you the location of the elisp files. The dumped emacs also expects this, so after the dumping process you have to set EMACSLOADPATH to the lisp dir.

The emacs.rc file should not have ^M's in it otherwise you might get an "Error in init file".

Other than the above I had no problems.

Bzzzt! Wrong.

Compact pro uses its own compression scheme and it is not the
same as a stuffit file. You will need to get the compact pro
package to uncompress that file. However, compact pro does
support self extracting archives which would probably work
fine if you have a GCR.

> Pattie Rayl (Atari Interface)
>
>

"Operation: A.C.T. NOW" is for everyone. You don't have to be part
of any association. This operation isn't just for dealers or developers
either. It is for users, developers, dealers, publishers, and
Atari Corporation.

A.C.T. stands for Atari Community Together.

Our first campaign is for EVERYONE to contribute things that they
think Atari is doing right and things that they feel the company needs
to improve.

We are hoping that Atari's management will listen to us so that
they can take action to increase the company's presence in the computer
market place.

Atari Interface can only do so much to help the Atari Community.

B&G Electronics (from Joe's last message) can only do so much to
sell computers.

If Atari Interface suggests ideas on what the company can do to help
increase user groups, they may listen. If Current Notes suggests the
same thing, they may do it.

The same thing with dealerships.

We hope that we can accomplish things that will help the Atari Community
and if you want to help, we certainly need you!

Len Stys, Cleveland Free-Net Atari SIG

Well at least GNU's gcc and g++ will (probably) work on the Falcon.
If you purchace the Falcon docs from Atari (my understanding is that
the general public can buy these), then you will know the DSP and
other sound and graphics calls.

>restoring it.

Not always true. It depends on how the backup is done. If it's an Image-based backup, where the sectors on the hard drive are read sequentially and written to the floppy in the same order, then a backup and restore will NOT defragment your HD.

A File-based backup, in which individual files are copied to floppy will have the effect of a defragment. It will be especially effective if you re-format your HD after you back it up, and before you restore it.

>for the out port?

Hi Steve, we meet even here :). I suppose you mean a soft-MIDIthrough? ST MIDI data always reaches the out-port (in principle), so the only problem is to get the in-data to the out-port - a 'through' that is. I have an ACC that does just that, and a prg that installs (TSR) a through-routine when run. I suppose the prg can be run from the AUTO folder. To be honest: I've never used it yet. I'll check it out and let you know.

When I format 720K disks on pc's, I use "format a: /t:80 /n:9". It's never worked for me when I've tried /n:10. It didn't even try; it just said "unsupported format" or something similar.

>I think you can. There is an argument when calling format
>on PCs which indicate the number of sectors per track.
>As I always used it with 9 sectors, I don't know whether it
>accepts 10. Just try !

>it's something like: C:> format /N9 b:

It's true, you can use parameters of the DOS format command:

FORMAT B: /T:80 /N:9

is guaranteed to format an Atari-readable disk on any 3.5" drive
(note the colon). BTW, problems often arise because virtually
all PCs have HD 3.5" drives, and DOS tends to attempt to format
ll 3.5" disks as HD disks.
However, you can't format 10 sector disks under DOS. I think this
is due to some strange way of DOS to obtain the format
information from the boot sector. There are entries in the boot
sector specifying the number of tracks and the number of sectors
per track on a disk, but this information is ignored by DOS.
Instead, it uses the "media byte", another boot sector entry, to
jump to conclusions about the format. There's values of the media
byte specifying double sided 40 track disks, one-sided 80 track
disks (Atari ss 360KB format) and double-sided 80 track disks
(Atari 720 KB format). All these are 9 sector formats, there must
be more specifying HD formats of course, but I know of none
specifying 10 or 11 sector formats...
So, as far as I know, there's no chance that a DOS version that
is already available can read 10 sector disks, and future
versions of DOS won't do it unless they either switch to using
the information in the boot sector or introduce new values for
the media byte specifying 10 sector formats.

2882. Atari Falcon Q&A

Newsgroup: comp.sys.atari.st
Date: 1992-09-20 02:18:16 UTC
From: dcurtis@nyx.cs.du.edu
Message-ID: <1992Sep20.021816.16299@mnemosyne.cs.du.edu>
Source record: 217493

This is a transcript of a Q&A session with Atari on Compuserve. News about the planned demo at Boston on Sept 23 is appended at the end.

> CIS Falcon Conference STR FOCUS! Atari's Bill Rehbock in Conference

Welcome the CIS Electronic Convention Center...
The Atari FALCON030 Online Conference is now beginning...
Your moderator is Sysop, Ron Luks

(Sysop Ron Luks)
Welcome to tonight's online COnference...

With special guest, Bill Rehbock, director of software development and head of FALCON development. Tonight's CO will be in a moderated format to get "in line " to ask a question just type /QUE. Now, without any further ado here's tonight's guest, Bill Rehbock. Okay, Bill, get on the hotseat. ga

(Bill Rehbock)
Thank you Ron. I am happy to be here on Compuserve tonight. Things have settled down since the Duesseldorf Atari Messe. The Atari Falcon030 has been well-received by the European press and production Developer pre-production machines have been replaced with production machines and application development is speeding up. I also have good news regarding Atari Falcon030 FCC testing. The Falcon has passed FCC Class B specifications and we are waiting only for paperwork certification. Richard Miller, our VP of R&D is here too and he and I will be happy to answer questions regarding the Atari Falcon030, MultiTOS, and FSMGDOS tonight. Fire away! :-)

(Pattie @ AIM)
Bill, how is the schedule for Falcon's release going? Originally, there was word that fairly large numbers would be available in late fall. Is that still true or is the rumor that we will see only limited quantities till the new year true? ga

(Bill Rehbock)
Pattie, we are still on schedule and believe that the quantities will ramp up as the end of the year draws near. The initial quantities will continue to go to Europe until we have the FCC Certificate in our hands which should still be at the end of Oct.. I am still very optimistic about the production schedule. ga

(Sysop Ron Luks)
Bill-- give us an approx number. After you get FCC papers in hand. How many Falcons will ship to the USA? (this year) ga

(Bill Rehbock)
Ron, we are discussing quantities right now with the U.S. sales department. From the looks of it, I (in software development) am confident we will be able to satisfy the initial needs between October and Christmas.

(Alan Page)
I have been using MultiTOS (as part of the beta test) for several months now on a MegaSTE. I find it very usable on that machine. I was quite disappointed to read conference transcripts stating that MultiTOS was not going to be available I have been using MultiTOS on a MEgaSTe for a while. It is very good, so I was disappointed to hear that it would not be available for the 68000 machines. It would greatly enhance the market for MultiTOS-friendly software. WHat is the reason for this decision and is it cast in concrete? ga

(Bill Rehbock)
It is _definitely_ NOT cast in concrete. Many of the developers have found MultiTOS surprisingly useful even on 8MHz Stacys. The reasoning due to the large benefit of memory protection.

(Alan Page)
I urge you to consider making it generally available.

(Bill Rehbock)
I understand. Thanks ga

(Chris Dammers)
Okay, will MultiTOS be compatible with all existing software, to your knowledge? And will there be any major advertising in Europe? ga

(Bill Rehbock)
Chris, MultiTOS is extremely compatible with existing GEM Applications. It is even friendly with TOS and TTP apps by opening TTY windows for them to run in automatically. Older ST software like Pagestream, Calamus, TouchUp, EasyDraw, and all the favorites work quite well. There are developers working on C++ environments for TOS so the Falcon will have powerful software to complement the hardware.

I do expect the European Business Units to promote the Falcon heavily both thru PR and marketing. ga

(Beth Jane Freeman)
Can you use peripherals from the ST, like the monitor, external ICD HD & floppy with the falcon 030? I like the idea of the 1.44 drive for drive A. It's much better than a minimum 360k or even a 720k. Good idea!! Sorry, I uploaded my question from the capture buffer, so it would be neatly typed. ga

(Bill Rehbock)
The Atari Falcon030 will accept any of the following monitors: SM124 (or equivalent), SC1224/1435 (or equivalent), or any VGA monitor. You can also connect TV. Hard drives are a little trickier. We removed the ACSI DMA connector in favor of SCSI II, which is much more reliable and the

up-to-date standard. You can connect most old hard drives by bypassing the host. There are several 3rd party developer working on SCSI II to ACSI adapters to allow direct connection of SLM Laser Printers and unmodified HDs. I keep getting told by CIS that I am speaking too quickly :-) You can connect most old hard drives by bypassing the host adapter, which any dealer should easily be able to do for you. ga :-)

Moderator recognizes Sam Rapp

(Sam Rapp)
Will it take a can opener to get in the Falcon (metal shields, Tabs, lots of screws) Or is it easy access? How'd you guys get it through, no.. Let me restate that. Is the Falcon030 easy access, or do you have to take out 800 screws and bend 400 tabs and light a few sticks of dynamite to get to the processor slot, memory stuff, and Hard drive? Also, how'd you get through FCC so quick? Thanks. GA

(Bill Rehbock)
As a past dealer/VAR, I can empathize with the can opener thing. The shielding has been completely redesigned so that all that is needed is a #1 & #2 Phillips screwdriver. The shielding is easily removed to allow addition of larger HDs, memory boards, or expansion boards. The first pre-production machines went through FCC testing as a "dry run" to find exactly where the quirks would be. The production rev motherboards were engineered and sent to FCC as the first units came off the line. You can tell that we've become very intense on the FCC thing. ga

(Pattie @ AIM)
I understand that you might not be able to tell us every detail, but what are Atari's plans to market the Falcon, especially those plans geared to bringing in New Users? ga

(Bill Rehbock)
Step 1... Take good care of existing users. Step 2... Promote the product through PR and specific market area advertising in conjunction with dealers to make it easy for existing users to evangelize Falcon030 to their friends. We need to get the word out so that people have heard about the machine _before_ going into an Atari dealer or seeing one at a friend's house. ga

(Chris Dammers @ STF)
Seeing as the specs of the Falcon seem Formidable. Have you any plans to do more arcade conversions as well as Steel Talons? If so, could you give us their details, as well as Steel Talons'? ga

(Bill Rehbock)
We are working with many of the entertainment houses, the bulk of which do their 68000 (Atari, Mac, and Amiga) development in Europe. I believe that we will see many strong titles being developed quickly. (Produced both by Atari and 3rd parties.) ga

(mERCURY mAX)
Are a/d and d/a converters;if so what are I read that the Falcon has 8 track hard disk recording. ga

(Bill Rehbock)
The Falcon030 has built-in 16-bit ADC's and DAC's that will allow sampling at rates up to 50KHz. We plan to have a very simple-to-use Stereo direct-to-disk recording and edit system shipping with the machines. To do full 8 track (4 Stereo) recording and editing, you do have to add and external box (several are in the works by 3rd parties) with the additional DACs/ADCs in it. This box would also have the inexpensive crystal necessary to do sampling at 44.1 and 48 KHz sampling rates. ga

(Bill Aycock)
Will Falcon TOS and/or MultiTOS allow a NEWDESK.INF file to be larger than 8192 bytes? I could only customize my STe halfway because I exceeded the size limit! Also, will the Falcon have a fan built-in? :-) ga

(Bill Rehbock)
Yes, with the Hard Drive, DSP, and RAM, a small internal fan was necessary. The Limit on NEWDESK.INF has been lifted as of MultiTOS. ga

(#8,Bill Aycock)
(Good news on the fan, long as it's quiet! hehe)

(Sysop Ron Luks)
Bill--before we go on to the next question. Could you please describe the difference between Falcon TOS, MultiTOS and tell us what will ship with the first batch of Falcons? ga (difference between Falcon TOS and TOS 2.06 I mean)

(Bill Rehbock)
"Falcon TOS" has already shipped with the fist batch of Falcons. It has support for all of the DSP, Sound DMA, and other new Falcon hardware, as well as O/S support for hierarchical menus, pop-up menus, 3D Window and Dialog objects, and full-color animated icons. MultiTOS adds all of the pre-emptive multitasking features on top of that, as well as extended interprocess communication and loadable file systems. The VDI in "Falcon TOS" has the necessary support for the new video modes, including overlay. ga

(Alan Page)
If I have a video camera, what sort of hardware do I need to do video overlay (with genlock) on the Falcon. e.g. video titling. Is it plug and play right out of the box, or do I have to wait for the usual 3rd party developers? Seems you are relying an awful lot on 3rd party and external hardware. Also, can it overlay both RGB and composite video?

(#25,Bill Rehbock)
I would say that we are trying to leave the market open for 3rd party development. The box for doing overlay and genlock is relatively simple. It only needs to extract the external sync from your external video source, inject it into the external sync input on the 19-pin video connector, and

output either Falcon video or external video, depending on the state of the overlay pin on the connector. It can overlay RGB or composite. ga

(Sam Rapp)
Ok, a few more questions;
1: Can video modes be switched without rebooting? (can I have a 'base' boot resolution and let the software pick it's own modes?)

2: Can you elaborate on Animated' Icons?

3: What other software will ship with Falcon (basic)?

4: How can I get system docs on the Falcon without spending major bucks to register as a developer? Thanks! GA

(Bill Rehbock)
Software can make a new set resolution call that will put the machine in the requested video mode. The AES will be unavailable in this mode, but the application will have full VDI support. This is primarily for games and paint and animation packages that will want to run their interface in the current user-chosen res, but be able to render or output in say, 384x480 overscanned truecolor with overlay. The preview could be displayed in a 16-color desktop window, but the application would do a wind_update and go to the desired mode for final output. It would return to the user's mode afterward and release wind_update. This works with MultiTOS very well.

Color Icons allow multiple color resolution icons to be carried in a resource file in both non-selected and selected states. When you select an icon, it will flip to the other image, giving an animated effect. Calappt, a Personal Information Manager that has the ability to import and export delimited file formats as well as Portfolio databases will ship with F030. Procalc, which many of you may be familiar with, as well as a True-Color Breakout with digitized sound and a game called Landmines. The real neat stuff is the System Audio Manager, which allows you to record your own sounds to replace any or all keyclicks, or accompany the various AES events, such as window openings & closings, the file selector, etc.. There is also the Direct-to-disk recorder that I previously mentioned. We are also shipping a Talking Clock with the machine. BTW, the external hardware issues have been dictated primarily by the potential quality required by a set of users. (95% of users are not going to need 8 DACs/ADCs) and the quality requirements for the Video will vary greatly between consumers and professionals. ga

(Bill Aycock)
Sorry, I changed numbers and didn't have a question in mind. But, will the Atari HD utilities ship with Falcons that don't include a hard disk? ga

(Bill Rehbock)
Bill, I think they'll be included in the box (I am not sure) but they have always been posted online and available to dealers. Because of the external SCSI situation, we will make sure that the utilities are readily

available. thanks! ga

(#5,George C.)
Just a quickie: Will MultiTos ship with the first batch of Falcons to the US?

(#25,Bill Rehbock)
Yes, it should. ...with the exception of developer units which will ship between now and October. MultiTOS will be softloaded for them.

(Sysop Ron Luks)
Okay. Thanks to Bill Rehbock and everyone who showed up to this CO. I apologize for the sluggish system response. However, if we can twist Bill's arm to return again later this fall, I promise a faster system.

Thanks all. The CO is officially ended.

The conference has ended .....Thank you for attending

--------- FALCON DEBUT AT BOSTON COMPUTER SOCIETY

If you would like to see the new Falcon 030 from Atari, you're invited to attend the BCS General Meeting September 23rd.

The North American unveiling will be held at 7:30 pm Wed., Sept. 23 at the New England Life Hall, 225 Clarendon St, Boston. Atari has also promised to loan a FALCON 030 for a hands-on demonstration the following evening, Thursday September 24th. This event is slated 7:00pm in MIT's Bdg. 4, Rm. 270. You need not be a BCS member to attend either meeting, and admission is free!

Place Your Atari Falcon030 Developer Machine Order Now

Atari is taking commercial-level developer orders for the production-level Atari Falcon030. These developer machines will be shipped with 14MB of RAM and a 65MB harddisk. Delivery is expected to be sometime during the month of September. This offer is open only to Commercial-Tier Developers. Please contact Gail Bacani at 408-745-2022 or myself at 408-745-2082 for pricing and shipping details. Please try to have your order in by September 4th.

-Bill Rehbock, Director of Application Software

>towards some old A500 software and that you need an extra chip from

Try to stick to the truth boy. A600 sucks yes, but it sold 60,000+ units in the first two months after release in the uk - that was when the A500 was available at a lower price. The A600 has since then been dropped 100 pounds. Yes the A600 really sucks... but its all some people can afford.

>...I know of no PD or Shareware thesaurus.

Try to locate the dbWRITER 1.8, a very nice monochrome-only word processor with Dictionary and Thesaurus. I believe that the files have been uploaded to the atari.archive.umich.edu FTP site.

On the other hand, if *I* were writing a book, I wouldn't depend on a relatively limited electronic thesaurus. A copy of _Roget's_Thesaurus_ is less expensive, more practical and a whole lot more interesting. It can also lead you to lines of thought on a subject that would never be available through an electronic thesaurus.

Electronic spelling checkers are great, checking symbols is one thing that a computer does well. Grammar checkers can also be useful, although they are also limited in their ability to interpret ambiguous phrases. A thesaurus turns out to be under-utilized in a word-processor. When heavily-utilized, it tends to restrict one's method of thought because of its limitations.

Well I have been recently using an AMIGA computer with a Video Toaster, and I must say that it's been an experience.. I am a loyal ATARI user, and never thought I could get so much pleasure out of using an Amiga. :)

No I'm not switching platforms, I'm wondering if theres something like that for the ST?
I have an ATARI 1040 STE, and I know its graphics capabilities may be a bit limited for that kind of work, but maybe a Falcon?

I want to know about both existing software/hardware and the ones to come for the Falcon. I am looking for stuff that the Video Toaster will do, TV Quality stuff. If anyone knows, please reply.

Thank you,

Alberto

> about MS support are a lot worse !

There is NO 3rd party support at all in New Zealand!

IBM and mac are the de-facto standards, with massive support infrastructures.

Amigas have considerable home penetration in Australia/New Zealand, due to
their better marketing strategy. (They actually place adverts, unlike the
Atari agency...Could this be because Commodore actually market the things
themselves [Commodore (NZ) and (Aust) Ltd] rather than entrusting one
of the most crucial parts of marketing to a company which is far more
interested in selling PC clones than Ataris???)

The ONLY significant penetration of Atari in Australia/New Zealand is in the
musical instrument field. (And they aren't going through the 'official'
agents as far as I can tell)

>
> >PRICE: The MEGASTE 4MB without a monitor sells for A$2,795.00 here

> >Fred
>

The same thing applies in New Zealand. It is actually cheaper to fly to
Hawaii and buy a Mega 4 STe with 52Mb HDD than to buy one locally.
(you can do some shopping with the change too).

The local prices show no sign of coming down, and it is extremely doubtful that the Falcon will ever see these shores. (After all, Megas and TTs have to be ordered specially, and take up to three months to arrive)

From: aa399@cleveland.Freenet.Edu
Message-ID: <19i5f7INNjdn@usenet.INS.CWRU.Edu>
Source record: 217405

Many people sent replies to the Atari SIG (xx004@cleveland.freenet.edu)
asking for information on the Boston Computer Society meeting.

Well, here it is:

The North American unveiling of the Falcon 030 by Atari will be held
at 7:30 pm Wed., Sept. 23rd at the New England Hall, 225 Clarendon St.,
Boston. Atari has also promised to loan a Falcon 030 for a hands-on
demonstration the following evening, Thursday September 24th.
This even is slated 7:00 pm in MIT's Bdg. 4, Rm 270. you need not be
a BCS member to attend either meeting, and admission is free!

"Operation: A.C.T. NOW" will release a list of organizations that you
can contact to cover the Falcon unveiling. However, this list will
be small and it would be short notice.

If you wish to see your local newspaper or network cover it, the
best thing that you can do is contact them and inform them of it.

One of the campaign organizers were told by an Atari representative
that Atari has contaced close to 200 members of the press.

2894. Advice on user-interface needed

Newsgroup: comp.sys.atari.st
Date: 1992-09-20 16:30:55 UTC
From: hjv@phil.ruu.nl
Message-ID: <hjv.717006655@groucho.phil.ruu.nl>
Source record: 217406

This is a request for advice on the design of a user-interface. So
all fellow-programmers and interface-designers, please continue
reading :).

I'm currently working on a librarian for a synthesizer. The program
has its own desktop (yes, I know...) in which 100 sounds are viewed,
together with various icons (synth, disk, clipboard, trash). The user
can do various things with those sounds and icons. E.g. double clicking
a sound enables the user to rename a sound, double clicking the disk
icon opens the fileselector (Open file...), single clicking a sound selects
it, etc.
There are some actions the user should be able to perform, but I'm not
sure which physical actions should be associated with them - e.g. sounds
are selected by left-clicking on them, but it should also be possible to
select more than one sound, without releasing the mousebutton, so should
'left-click and drag' do the 'multi-selection', or should an additional
SHIFT-key be pressed? Etc., etc. Some actions are obvious and are already
implemented:

select sound: left click
rename sound: double left-click
drag icon to sounds: left-click and drag
drag icon to icon: left-click and drag
various 'double-click icon' operations

What needs to be implemented is:

multi-select sounds: left-click and drag
drag sound to sound (copy): left&right-click + SHIFT and drag
drag sounds to sounds (multi-copy): left&right-click and drag
drag sounds to icons: left&right-click and drag

The physical actions above are the way it's implemented now, but this
obviously isn't satisfactory. E.g. 'drag icons to sounds' is essentailly
the same action as 'drag icon to icon', and that's why the same physical
action (left-click & drag) is associated with both. However, the last
two actions, 'drag sounds to sounds' and 'drag sounds to icon' are *also*
essentially the same, so 'left-click&drag' would be preferable to
'l&r-click & drag'.
But suppose we did it this way, in that case the 'multi-select' had to be
implemented differently, e.g. 'left-click + SHIFT & drag'. One problem is
that in this case, the multi-copy would be 'left-click & drag' - but
what should the single copy be then? Left&right-click & drag? It's not
logical IMO to let a 'copy' operation be more complicated (one additional
mousebutton) than a 'multicopy'. On the other hand it is desirable to have
the 'sounds to icons' be the same as the 'icons to sounds' - and it's

unavoidable that 'sounds to icons' is the same physical action as 'multi-copy' (= 'sounds to sounds').

I don't know if I've made the problem clear - a bit difficult to explain if you don't know the program :) If someone understands my ramblings and has any ideas on the matter, please let me know - preferably by email, since I think the subject isn't too interesting for the whole net-community.
O, BTW, in case someone thinks of it: 'right-click and drag' is out of the question, due to graf_dragbox behaviour (wish it were different...)

MANY thanks in advance.

I've seen similar post's before but didn't take enough notice...anyway here goes! Does anyone know the specifics of upgrading to TOS 2.06 (from a lowly '86 STm, TOS 1.0). I've heard of (I think) a 'TEC' from a US company..or was it German? Anyway, I seem to remember it was switchable between your original Tos version and 2.06...is this correct? Can anyone recommmend this card...or not? Also, I seem to remember discussions about 'chip sets' (4 vs 6 I think...yeah I have a lousy memory!). Should I worry about the number of chips my TOS has when ordering an upgrade? And, of course, what are the prices on these upgrades? I checked the FAQ and couldn't find this so I could probably post a summary if enough people reply with info. or show interest in finding this out also! Thanks muchly in advance,

T.T.F.N.

>Amiga.

Yes, I've loaded some IFFs with Photochrome. They weren't particularly good pictures, and I've no idea where they came from (they were from a disk around 4 years old), but they loaded and displayed correctly.

2901. JOVE for MiNT uploaded to atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1992-09-20 20:25:37 UTC
From: dstailey@leidecker.gsfc.nasa.gov
Message-ID: <DSTAILEY.92Sep20152537@leidecker.gsfc.nasa.gov>
Source record: 217417
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

After about a year, I have somewhat reluctantly decided to release my port of the JOVE text editor, V.4.14.6, by uploading it to atari.archive.umich.edu. I say reluctantly, because I wish that it could have been better, but I just haven't had the time to work on it. However, I have been using this editor constantly for a year now, and so the usefulness of the JOVE environment convinced me to upload.

The good news is that all of the process control and job control features work, and that the ptys are implemented, allowing an interactive shell window. The commands for compiling and interactively linting your source code are available (M-X compile-it and M-X next-error). Other process control functions include:

shell-command (non-interactive)
i-shell-command (interactive, asynchronous, and multiple i-shell-commands run at the same time)
shell-command-to-typeout (non-interactive, doesn't send output to a text buffer, but writes directly to the screen, using
a pager)
shell (interactive shell of your choice. Make sure SHELL environment variable is set)

JOVE uses termcap, and will run from the console or under TOSWIN or MGR. The special keys are implemented (function keys, etc.), but in a kludgy way that breaks under MGR. This port would vastly benefit from the addition of MiNT's xkeys feature.

The F2 key is bound to display-bindings. F1 is the help key, and it requires that cmds.doc be in c:\jove\lib, or you will have to fix the environment.

When reporting problems, remember that I have been using JOVE for a year, and so I am aware of most of the problems. Sorry about the ^Ms showing up in all the interactive process windows. Source is provided for the adventurous. I have ifdef'd all of my modifications. getch.c is a complete rewrite, to implement the special keys. The quadruple backslashes are used in the makefile, because the lines get fed through sed. Aren't they gross?

Oh, yes, one other thing. Make sure that you use the drive u: notation when changing directories or referring to files on other drives. Otherwise, the readline emulation breaks.

Believe me, with all of it's shortcomings JOVE is still an extremely useful programming environment. Jonathan Payne did an excellent job.

(And the memory usage is minimal, especially compared with emacs.)

Doug

Message-ID: <1992Sep20.155210.13021@miavx1.acs.muohio.edu>
Source record: 217412

Well, after seeing all the hype about the Freeze Dried Terminal and CoNnect 1.52, I though I would try them out. Well FZDT was of no use to me due to the fact that it doesn't offer vt100 emulation. I then tried CoNnect. It looked really nice, and I like the fact that it supports vt220, but it kept on bombing on me. I had it bomb 4 times before I gave up on using it and decided to stick with Uniterm. Has anyone else had problems with CoNnect bombing? I have a 1040STf with TOS 1.4, and two floppies.

Thanks.

2904. Problem with gcc2.2.2pl3 & sscanf

Newsgroup: comp.sys.atari.st
Date: 1992-09-20 23:16:25 UTC
From: peterj@garfield.t-informatik.ba-stuttgart.de
Message-ID: <19j0oaINNmo7@nic.belwue.de>
Source record: 217419

```
Hi,

if I compile the following programm under gcc2.2.2pl3 it bombs

#include <stdio.h>

main ()
{
char test[100] = "%Page: 2 1\n";
int i1;

sscanf (test,"%%Page: %d", &i1);
}

I figured out that it is due to the sscanf, the "%%" in that function
seem to cause problems., If I change that line to

sscanf (test+1, "Page: %d", &i1);

if works. I'm not sure which version of the libs I'm using, my /gnu/lib
looks like:

total 1883
-rw-rw-rw- 1 root root 1873 Jun 25 1992 crt0.o
-rw-rw-rw- 1 root root 2004 Jun 25 1992 gcrt0.o
-rw-rw-rw- 1 root root 70692 May 2 1992 gem.olb
-rw-rw-rw- 1 root root 70428 May 2 1992 gem16.olb
-rw-rw-rw- 1 root root 151086 Jun 25 1992 gnu.olb
-rw-rw-rw- 1 root root 150990 Jun 25 1992 gnu16.olb
-rw-rw-rw- 1 root root 590294 Apr 30 1992 gnug.olb
-rw-rw-rw- 1 root root 589294 Apr 30 1992 gnug16.olb
-rw-rw-rw- 1 root root 6210 Aug 5 1992 iio.olb
-rw-rw-rw- 1 root root 5994 Aug 5 1992 iio16.olb
-rw-rw-rw- 1 root root 403 Jul 17 1992 mcrt0.o
-rw-rw-rw- 1 root root 142590 Aug 5 1992 mint.olb
-rw-rw-rw- 1 root root 139742 Aug 5 1992 mint16.olb

Am I using an old version of the libs? What else could cause this
problem?

>but when I unpacked the file, "fmt" was missing.

As are the other auxiliary programs (elvpreserve, etc). You are better off using the ELVIS 1.6 port that should also be at a.a - it is slightly less capable in the key-mappings department, but is more TOS compatible than the port I did (1.5), which was focussed on MiNT (which 1.6 also supports). The 1.6 port has all the auxiliary programs you'll need.

One of the best things about this new Elvis is the "errlist" integration. You can type ":make" (or :cc), and Elvis will make (or compile), and redirect the errors to a file "errlist", then interactively step you through the errors ("*" to go to next message). It even keeps track of line number changes, so if, for example, in correcting the first error, on line 150, you add 10 lines, then the next error, at line 200 according to make, will actually be at 210 - and Elvis will put you there. It even changes files as need-be (providing your compiler gives fairly standard error message lines - GCC does, for one).

>accepts 10. Just try !
>
>it's something like: C:> format /N9 b:
>(but check in a man page)
>
> Stefan Monnier

I don't think it's as easy as you say. I've tried to format a disk with
a PC by typing 'FORMAT A: /N10' (maybe it was '/N:10'). It didn't work
with MS-DOS 5.0. Maybe there's another way to manage it?

The only way for my Atari to communicate with a PC was to format the
disk on the PC by typing 'FORMAT A: /F:720'. I've read very often the
Atari disk format is DOS-compatible since TOS 1.4, but as I *know* it is
not.

Knarf

P.S.: Sorry answered by e-mail but I read your reply in
comp.sys.atari.st after your e-mail. I'm just editing the file in my
usr/spool/mqueue... :-)

Many questions - I try to answer some...

I bought a Tos Extension Card (TEC) at the Atari Messe in Duesseldorf at
ddd (digaital data deicke) for only DM 111.- (about US$ 75). I took me
less than half an hour to install the card into my MEGA ST. If you have
an ST without Mega-slot you'll have to solder a socket on your CPU! (Not
quite easy!). If you want to switch between your old TOS and the new TOS
2.06 you'll have to solder a little bit more...
Hope you won't ever switch to your old TOS 1.0 :-)
I've never needed to switch to my old TOS 1.4. If you want to install
'WINX' (40 windows, minimized window items, scrolling not-top-windows
and more...) you need the program GEMRAM in your AUTO-folder to copy
your GEM into RAM (quite silly, ey? Buing ROM's and copy parts into RAM :-))
With TOS 2.06 you may use many icons, your computer is waiting for your
hard disk when switching on both(!) and you can (re)boot without your
harddisk by simply pressing ALTERNATE (or was it CONTROL?). There are
many other hidden features in this new TOS! (RTS/CTS Handshake works!)

I'ts not interesting you either have two(!) or six ROM Chips to install
your new TOS.

Question: Can I use my two old TOS 1.4 Chips in an old ST with six
Chips? (I think I cannot....)

>Jeoff Hines c556212@mizzou1.missouri.edu

Jeoff,

If thats what you have to do to earn browny points consider going
to a different University.

AT LEAST do something that is informed like structured analysis and design..
(Yourdon method is my favorite...most of the time) Anyone who makes their
students draw Flow Charts or even suggest to do so as extra credit should
be shot.

If you like to draw pictures...May I recommend Super Paint 3.0 for the
Mac or maybe MacDraw. Draw Packages usually are good in designing
structure/blueprint diagrams.

Although you CAN use an ST package, BUT it will be a PAIN to use.
(Yeah yeah yeah, I know...this is csa-st...SO WHAT)

And while your at it, Get Ian Sommerville's 3rd edition Software Engineering.
If you are going to draw pictures you mine as well draw them correctly.

Better yet, write me and I'll give you a hand if you need it.

-Greg

Call 414-339-0649 or live in darkness for the rest of your putrid existence...

Thank YOU!

>drag icon to icon: left-click and drag
>various 'double-click icon' operations
>
In the interest of compatibility, I'd advise you to design it in the same way as the desktop, ie:

multi-select sounds(box): Left-click and drag (starting on empty space)
multi-select sounds: Shift on any select should keep what was there before.
drag sound to sound (copy): left-click and drag(starts on sound, not space)
drag sounds to sounds (multi-copy): don't you mean drag sounds to sound? same as above.
drag sounds to icons: same.(lc(sound)+drag)

Shouldn't multi-copy just be the same as multi-select and drag?

If you get a program called FDFORMAT (garbo.uwasa.fi:
/pub/pc/diskutil/fdformat.zip or something very similar) it will allow
you to format IBM disks to 10 sectors (820 K) and the ST will read
them. You have to run a small TSR before using it and before reading
and writing with the 820K disk, but this is easily added to an
autoexec.bat file.

Source record: 217290

What I'm wondering is:

1. Can the Falcon be bought in a Mega Style case?
2. Can the Falcon go past 4 megs of Ram.
3. How are you suppossed to get files onto your HD if there
is no Floppy Drive or Port?
4. Will there or is there a 040 Falcon? and is 16mhz the fastest
it can run at...

It sounds like a nice system, but soon there will be SSVGA graphics out
for IBM, and VGA will be like using CGA on IBM. There will also be 24
bit sound cards, and faster systems... sigh... what a tough decision.

> Piracy is a problem...

PIRACY IS THE SOLUTION!

The more a program is copied, the more people see the ads, and
the more is a sponsor going to pay for the next release! Of course
what I meant was $10.00 pure cost of copying a disk and a manual.
The 'true commercial software', exactly corresponding to 'true
commercial TV' is supposed to be completely free.

I'm convinced that Coca-Cola (in reaction to the Pepsi Games)
would be happy to pay a bunch of money to support a free release
of WordPerfect 8.6 or however far they've got. The real problem
for this case is, the fact that WordPerfect costs a lot of money
is probably the only reason why people think it's such a good
package. I prefer VI.

Some people wanted something to compare with the Falcon 56001 DSP...
A NuBus card for the Mac called the SoundScope 16 features 16 bit i/o
and a 56001 DSP. Nothing really special about it.

The price for the board is over $3000!

=DC=

In article <1992Sep16.225556.17563@debug.cuc.ab.ca> Conan.Ford@debug.cuc.ab.ca (Conan Ford) writes:

>Hi, how can I find the x and y screen resolution, preferably with a VDI >call? I'm using GFA Basic but I can use an Assembler or C routine.

The resolution is located in work_out[0] and work_out[1]. This array is initialized after calling v_opnvwk().

To make that call, you need to do the following (in C):

If the program is NOT started from the Auto-Folder:
- call appl_init()
- get the "physical" handle of the screen driver with graf_handle()
(handle = graf_handle(&wchar, &hchar, &wbox, &hbox))
- initialize work_in[1] - work_in[9] with the desired atrributes (all 1s will do fine)
work_in[10] = 2
work_in[0] = Number_of_Screen_driver (often 1 will do fine, if you don't use GDOS-Fonts)
- Reserve space for an integer work_out array with 57 elements.
- call v_opnvwk:
- v_opnvwk(work_in, &handle, work_out)
- the virtual workstation handle is now in the variable "handle".

Don't forget to close the workstation after the program is finished:
v_clsvwk(handle)
And make an appl_exit()-call, too.

Message-ID: <meulenbr.717082151@cstw168>
Source record: 217435

Hi,

I'm looking for software for my 3 year old sons.
Of course PD is preferred, but I'd be willing to pay for a good
commercial package.

problems:
- the potential users are 3 years, so they cannot read, so the
stuff should be selfexplaining.
- the potential users don't know english (only dutch).

This means that a package should be rather selfexplaining.

Does anyone have pointers to good packages??

Thanks,

2925. Samples and Falcon...

Newsgroup: comp.sys.atari.st
Date: 1992-09-21 15:15:16 UTC
From: elendir@ulysse.enst.fr
Message-ID: <2547@ulysse.enst.fr>
Source record: 217440

As for digital to analog conversion, the perfect filter has a temporal transfer fonction looking like sin (x)/x, and is therefore non causal (It uses future samples to compute the present signal). Such filters cannot be made, and one has to cope with first order sample and hold approximation. This one generates phase and amplitude distorsion, that's right. But amplitude is generally corrected by an anti-aliasing filter, and phase errors are not very important since the ear completly ignores phase.
However, the distorsions can be reduced by oversampling. Oversampling makes low pass filters easier to design (Because, although sampling frequency is higher, audible frequencies do not increase. I mean, e.g. with basic 44.1 KHz sampling, if you want to let 20 kHz frequencies unaltered and supress aliasing you have to design a filter with at least 60 dB cutoff between 20 kHz and 44.1 /2 = 22.05 kHz, i.e at least a 60 dB in 2050 Hz ! However, in case of let's say eight time oversampling, the cutoff frequency becomes 22.05 * 8 = 176.4 kHz, and designing a 60 dB low-pass filter between 20 kHz and 176 kHz is not very difficult. Furthermore, the noise band is extended over 176 / 2 = 88 kHz, and the filter cuts off a signifiant amount. (I remember 3 dB of SN gain for each doubling in oversampling)). Oversampling is easily done by a DSP using interpolation (linear or whatsoever).
Thus there is no signifiant improvement in quality between 44.1 kHz, 48 kHz and Falcon's 50 kHz sampling frequencies. Just easier low-pass filter to design.
1 bit-DAC, such as those used on the Falcon improve linearity. They use a single tapped resistor instead of 16 or 18 in classical DAC. Of course, the process involves a special conversion and especially oversampling ; Falcon uses 80 times oversampling, which gives you performance near True 16 bits with 5 times oversampling.
Regarding the DAT to CD conversion, the Falcon is ideally suited to do such stuff, the DSP is useful in designing decimation or interpolation filters.
You can copy CD to DAT with no problem, but such an operation sets a protection bit which forbids DAT to DAT copy. Pre-recorded DAT tapes will also have that bit set. I don't know whether this bit is recognized by the receiving DAT (In which case it would be easy to delete it with a small DSP code) or just inhibits the digital output of the DAT (Seems rather corny if this is true).
Direct to disk demo program has been shown today in Paris at "Le salon de la musique". Falcon has really stunned the dudes there. Someone told me they picked up people near the booth at random, they shew them the Falcon and the guys went out quite mad !
Many European developers work on the Falcon. In fact, the first softs to be introduced on the market will be French offsprings... They will be shipped as part of the Falcon kit.
Back to CD, I heard sometimes ago that Philips had developped a new technology to built green-emitting (spelling ?) Lasdiodes, thus allowing a 20 % increase in capacity on normal CD. The width of the depressions on the CD must be kept over 10 times the wavelength to avoid diffraction effects.

Well, I guess the Falcon will be a great game machine, with many other good improvements...
But regarding the sound, it's the most perfect machine in this range of price. I am thinking about some FM real time wave synthetizis, a good (yet monotimbral) synthetizer with added effects. Let's dream...
Grand piano, pipe organ, glockenspiel, bass guitar, vocal chorus, electric guitar, mandolin, AM tremolo modulator... and tubular bells :-)
Anyhow, the system expansion board seems to be a 16/24, but this is unsure.
There is no external floppy connector, because there is no need for it.
GCR works without any additional support on HD disks, and now all the Macs are shipped with a FDHD drive.
The new 1.44 drive should be able to replace two 720 Ko floppies no ? But the new floppy disk controler is no more AJAX or WD 1772 but some custom chip hand made by Atari (Ajax was just a pre-version).

SO much for today.

Enjoy.

Vince.

2926. Re: Trying out Freeze Dried Terminal and CoNnect 1.52

2927. Changes to atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1992-09-21 17:15:55 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Sep21.171555.29432@terminator.cc.umich.edu>
Source record: 217439

A quick note about changes that will be occurring to atari.archive.umich.edu
beginning next Sunday evening, the 27th day of September in the
year of 1992. In order to increase visibility of directories within
subdirectories, we'll be making the following changes:

1. Each directory will now begin with a capital letter, regardless of
it's location in the hierarchy. i.e. /atari/new will become atari/New,
/atari/newitems will become /atari/Newitems, /atari/applications/math
will become /atari/Applications/Math, and so on.

2. Files that begin with a capital letter will be downcased. There
aren't many of these around, but an example would be ChpsChl.zoo, which
would become chpschl.zoo.

3. There is one exception to change #2, and that is the following files,
Index, CompInd.Z, New0, New1, New2, and New3, will be lowercased
but will be preceded by a 0 to draw attention to them.
Examples are: /atari/Index will become 0index, New0 will become 0new0, and
Help will become 0help.

Each subdirectory's index, formerly subdirectory/Index, will become
subdirectory/0index.

BART users: Please follow the above guidlines, and you should experience
no problems. Bart will be modified to accept the following changes.
Please refer to the help file after next Sunday for more information.

Any questions should probably be directed to me, Jeff Weiner, at
weiner@atari.archive.umich.edu.

Thanks and have a nice day.

weiner

Message-ID: <1992Sep21.154406.9742@bsu-ucs.uucp>
Source record: 217442

Listen, us Amiga owners don't post in the Atari newsgroups and say
how great our machines are. I am sick and tired of reading about the Atari
Falcon. I have not seen any of these machines.
Actually, the last time I saw one Elvis was using it at the local
computer labs. He left the lab, and got into his UFO spaceship (he's commander
of the north American squadron, doncha nknow?)

So, I am not going to say anything about my Amiga, the Amiga 4000 or
any of that because this is an ATARI newsgroup and I am a polite guy.

You CAN email me all you want, but my mail-server is definitely made
like rubbermaid made,-in other words, it bounces everything.

So, I appreciate it if you quit posting Atari Falcon articles in
comp.sys.amiga.advocacy.

As far as a "Toaster-like" piece of hardware for the STe/TT line - your only bet is a nice little piece of hardware called the CyberCube SunRise card.
It is a straight VME card (Mega STe and TT) and kicks the Toaster's hardware squarely in the butt! I'm talking programmable resolutions from 200x200 to 8162x8162 (virtual screen) - with a straight 24 bit displayable color scheme. It also has a VME buss pass-thru for other cards and an EtherNet compatible network hook-up that is REALLY fast - I believe it IS FASTER than EtherNet..
Not sure on the cost, it was shown at the ACT Atari Show in Toronto.....

From: Dirk_Steins@k2.maus.de
Message-ID: <A47738@K2.maus.de>
Source record: 217300

m>I'm adding an external scsi drive to my TT, and I was wondering, if I did
m>so, whether I should remove the terminators from the internal one.
m>I assume that the external one is the one that needs to be terminated.
m>Right?

No. You should terminate both drives. Only if you add more than one external scsi device to the TT then you should remove the terminator jumpers from the drives in the middle. On a scsi bus both sides have to be terminated. In a tt it looks like this:

```
bus bus
internal drive <===> TT <===> External Drive
(terminated) (terminated)
```

You have to terminate both ends of the chain. If you have more than one external device, it looks like this.

```
bus bus bus
internal drive <===> TT <===> External Drive <===> External Device
(terminated) (terminated)
```

Hope it helps.

Normally with only one internal drive the TT should be terminated inside but because of the very short SCSI cable in the TT this is not necessary.

2940. Need help with mail based archive servers

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 01:40:26 UTC
From: bhawker@oneb.almanac.bc.ca
Message-ID: <4TBHRB3w164w@oneb.almanac.bc.ca>
Source record: 217254
Cross-posted to: comp.sys.atari.st,comp.sys.atari.tech

I need help or advice on how to obtain a version of ff.ttp or other such program (decoded version) that would allow me to uuencode/decode files received from mail based archive servers such as spud.hyperion.com. I have received a uuencoded version of ff.ttp and had it decoded on a Unix system. The resulting archive (ff.arc) has been corrupted in some way and cannot be unpacked by Unix, Dos, or Atari based arc progs. ....Heeellllpp!

Many thanks!
Bruce

>this out also! Thanks muchly in advance,

The TOS Extension Card (TEC) is made by CodeHead Technologies, an American based company.

There are several packages available, according to which model of ST you have, but the one you want is the TEC "Basic Configuration Package" and it costs $139.99 US, with some soldering required.

There is no mention of anything about chips of any sort at all in this magazine (Atari Explorer Mar/Apr '92, a US mag), so I think you are pretty safe.

The number to Codehead is (213) 386-5735 (in the US that is), if you want to give them a call, or I'm sure you can find it/get it via a local dealer.

I believe you can retain your old chips if you want, at the expense of more soldering and a switch of some sort.

>floppies.

As far as FZDT is concerned, if its VT100 you are looking for, the ANSI mode should do the job. I believe the two emulations are basically the same when it comes to cursor control.

If you really need it, there is a PD program called Uniterm that I have seen around. You might be able to find it on some of the FTP sites.

The easiest way to print .TNY pictures is to get a program called
'Pic-Switch' which will view TiNY pictures, (as well as most others)
and will from memory, print them! (It will also convert them to .PI1
(degas)

Once the picture is on the screen, you should be able to hold down
ALTERNATE and tap HELP to print the screen anyway!!

2945. Motorola MPEG full motion video chip

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 05:35:20 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Sep22.053520.15517@news.Hawaii.Edu>
Source record: 217253

This is a description of the Motorola MPEG chip that will be
used in CD-I machines and computers:

==========

MOTOROLA ANNOUNCES THE "FMV"
A LOW COST SINGLE CHIP MPEG FULL MOTION
VIDEO DECODER FOR CD-I

The FMV brings the possibility of digital full motion video
imaging within the cost sensitive CD-I player.

The Full Motion Video decoder, or FMV, is a true single chip
implementation of the decompression scheme specified by the ISO
MPEG Committee. A 4Mbit DRAM remains external, but all other
functions and processing are contained within the FMV. It is
fully compatible with the MPEG Level 1 specification but also adds
specialized interfacing for easy integration within the CD-I
player environment.

The FMV is intended for decoding compressed full motion video
pictures, reconstructing video sequences and converting the number
of pictures decoded per second to a 50Hz or 60Hz display period.
It supports images at frame rates of 25Hz or 30Hz, delivering a
full active screen of 352 pixels by 288 lines. It also supports
user functions such as freeze, single step, slow motion and scan.

The input to the FMV is the compressed MPEG bitstream delivered
directly from the optical disc at 1.44Mb/second. However, to
future proof the device and the CD-I application, the FMV can
decode at up to 5Mb/second and accepts data transfer into its
bitstream FIFO at 10Mb/second. This also opens up significant
applications for the FMV in the PC and Workstation markets.

Upon receiving the MPEG encoded bitstream, the FMV strips off the
header information and extracts timing data to allow for
synchronization with the audio after decompression. It then
performs the variable length decode, inverse quantization and the
inverse DCT, characteristic of the MPEG process. Individual video
frames are reconstructed using the decoded block information,
previous frame data, motion vectors and inter/intra frame decision
data.

Still on chip, the FMV then generates 24-bit RGB, creates the
motion window and transmits it with a predefined border color.
This video output is synchronized by signals coming from the
companion Motorola CD-I Video Decoder and System Controller, or

VDSC.

The entire process relies upon an on-chip system controller to manage the data flow between all of the processing sub systems. Also, the device is obviously very dependent on its ability to handle the external bank of 4Mbits of dedicated video memory. It has its own memory management unit which handles refresh and controls the granting of data access requests.

With this component, the Philips and Motorola promise to have MPEG full motion video components ready for 1992 player launches has been fulfilled. It is expected that this will add a new dimension to the already CD-I platform, thus spawning a whole new category of CD-I titles.

"Following the late agreements on the MPEG standard, many companies have been chasing a programmable approach to MPEG decoding as an attempt to cut time to market," said Burgess. "However, by working with the market leader, Philips, we are releasing a fully compliant solution, implemented in a silicon optimized form and will still be early to market. We will provide MPEG video decoding in volume for under $30 with this approach," he added.

The FMV is implemented in Motorola's 0.8-micron triple level metal high density CMOS technology and comes in a low cost plastic surface mount 160-pin QFP package.

==========

Since CD-ROMs capable of 300 KB/s (2.4 Mb/s) are becoming available, the video output from the FMV chip would surpass laser disc quality. A typical 660 MB CDROM would only have the capacity for less than 40 minutes of video with a 300 KB/s rate, so it wouldn't be useful for movies yet! Special applications like teaching/training would be okay though.

Specs for the Falcon mentioned JPEG/MPEG hardware and a low cost solution like the $30 FMV chip would be nice to have.

>by a crystal, increase the resolution in the Falcon to things like
>1024x800 in 256 colors, or what have you. This does not slow down the
>computer at all, until you increase the resolution to the extent that
>the video chip starts hogging its share of the memory bandwidth.

Atari said 640x480 with 65K colors exceeded the memory bandwidth
so the limit must be less than 36 MB/s [640*480*2 bytes*60 hertz = ~36 MB/s]

800x600 256 colors use less than 30 MB/s so that might be possible and
1024x800 16 colors takes about 24 MB/s so the Falcon might handle
that too. 1024x800 mono is 6 MB/s so if possible would be great!

The specs mention that the memory controller operates in page mode so
that might mean that 32 bits are fetched multiple times and average
about 240/2 (160 ns cycle + 80 ns thereafter) = ~120 ns for memory
reads. With a 120 ns average then memory bandwith would be 32 bits
times 1/120ns = ~32 MB/s. The 68030 would have less time for high
resolution and color but the application could make the best choice.

My guesses could be all wrong though. :D

It will 'emulate' whatever version of TOS you plug into it. (And it doesn't 'emulate' it, it uses PROPER atari TOS chips - so it's as close to the real thing as an emulator is likely to get.)

It'll run pretty much as fast as the machine it's plugged into - but even if not, there are slowdowns for the IBM itself which would be easier to sort out!

Very good gadget! Another good reason not to buy an atari, seeing as this does everything for a fraction of the cost! (Okay, so the sound is awful on a bog-standard IBM/compat', but you're average person buying the GEMulator isn't going to want to play heaps of games, so it's not a big problem!!)

Darek has come up with a sure winner - When (IF) I manage to get rid of my ST, I'll have to try & buy it - but selling an atari is hard work, no one is interested in this country!

(There isn't an Atari dealer within 100miles of where I live, only one I know of in the ENTIRE country, and they don't deal to the public as such!)

Message-ID: <1992Sep22.073244.26685@alijku05.edvz.uni-linz.ac.at>
Source record: 217265

Hi There !

Why should I buy a Falcon ? Nintendo's Super Famicon is much better !
Just look at all those mighty guys writing Super Famicon games !
It's an armada compared with those writing Falcon games.

And the Super Famicon offers even the same power for a lesser price !

- 3D graphics chip for fast 3D games
- 512 hardware sprites
- 32K colors simulatenusly what is really enough for playing
- *very* smart CD rom drive

Ok, maybe there are some guys out there that would like to use the Falcon
for serious applications. But wouldn't it be *much* more efficient
to buy an IBM compatible for applications and a Super Famicon for
gambling instead of fooling around with a Falcon that lives from
announces and buggy software ?

Come on, tell some reasons *not* to buy a Super Famicon instead of a Falcon !

Michael Carrico asks about the GEMulator:

>What TOS versions does it emulate, and is it as fast as the 486 or is there
>slowdown?

The GEMulator board includes sockets for you to plug in TOS ROMs,
thus whatever version of TOS you use, is the version you get..

From what Darek has said, a 486 based GEMulator runs FASTER than
an ST.. a 386 runs a little slower..

(Have you seen what's happened to the prices of '486 based PCs
lately..? I just looked closely and was amazed...)

Regarding printing to an SLM printer on a TT...

The original posting didn't specify, but... ANY application which will need to print to an SLM printer * MUST * be running from ST RAM...

The ASCI DMA port (which the Atari laser printers use) is NOT available from TT RAM..

There's been a discussion of just this subject recently on CompuServe, and the word from Atari's Mike Fulton is that ST RAM is the only way to go for this application..

2958. Case Design for Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 08:05:09 UTC
From: annius@eri.research.ptt.nl
Message-ID: <annius.717149109@freyr>
Source record: 217266

Some time ago there was someone on the news who suggested that ST
users should help Atari by advertising privately. A better idea
would be if someone started designing a new case for the Falcon
for charity (and maybe even produce a million?). My idea is the
following: design it such that the board as it is will fit into
the case, and maybe just the drive and hard drive will have to
be moved. Make it look like a SGI indigo or something, but NOT
a keyboard computer and NOT something flat. It should make clear
to people AT FIRST SIGHT that this is not just a slight amelioration
of the old Atari series (like the 'amiga killer' STE).

I agree. Even here in the technological backwaters of Oklahoma University
we don't have to do flowcharts. That sort of stuff should have disappeared
along with the '70s.

Is there a beast to do flow charting on the ST? I would have thought
Atarians would be ABOVE such things. ;^) (For the humor impaired.)

Hey! Don't laugh so hard. I prefer VI over WP 5.1 any day, year, or century for editing ASCII files. *ESPECIALLY* if that file is a fairly repetitive source program.

The flexibility of the commands is unequalled (in my experience)! Show me a text editor that can do everything that VI can and do it easier and I will switch over to it. My opinion is that you won't be able to do it!

Although, I hear that EMACS is preferable, I can't FIND it much less use it!

>Jeff McWilliams
>EE Engineer --> Michigan Tech. University jjmcwill@mtu.edu

Well, its true, the Video Toaster is (as far as I've seen) unbeatable
when it comes to professional quality video effects/editing for a small
computer. It is not without its faults, however. First, its not like its a
$50 plug-in board for the Amiga, the bare bones minimum setup costs several
thousand dollars not counting the cost of the Amiga itself. Secondly, it
is DESPERATELY slow unless you have a very souped up Amiga. A friend of mine
uses one at work to do editing of stuff like videotaped weddings and
small-time commercial production. It has all the tools for creating 3-d
objects with incredible surface textures and detail, but he is using an
out of the box standard Amiga. After programming in his objects and the
desired animation he often tells it to start rendering and leaves it to run
for a week or more non-stop to see the results of his work. Still, its
a simply amazing device and I've never seen anything on an Atari (as much
as I love them) that even comes close. At this point it looks like audio
is the future of Atari, not video.

This is correct, a developer here in the Denver area (who will remain nameless)
has had one for quite some time now and I have (gasp) actually touched it.
Pretty little machine, hope to get one myself soon. Hopefully the developer
I mentioned is having luck getting his ST mega-hit product to work on the
Falcon, it would add one more reason to the list to buy one.

Ok, after wasting a lot of time tonight,
i've finally managed to succeed in getting a RAW file to a.a

It's in the atari/new dir, filename "esp01.lzh"
(archived with -lh5-)

I'll put some more there on Thursday (Wed for you americans when you
take the time diff between the countries). It takes me a while as
I have to upload them at 2400 bps to this site first.

And a friendly reminder in case anyone gets the wrong idea,
I did *not* write Photo Chrome! :-)

Craig.

> GhostScript from GemGS, that's why I didn't get this error myself.
> Thank you for your bug report, I'll get into this. Any new releases will be
> announced in this group...

I found the reason for the trouble described above: it was GNU lib PL82 which
behaved not very friendly under MiNT!! The endless stream of error messages
was performed by MiNT. So I recompiled GS with MiNT lib PL20 and had no more
problems.
The new version will be uploaded within a few days, the old buggy one is no
more on the server.

Thanks for your patience,
Markus.

> cpu performance, but I am gonna compare it to what other companies rate
> their CPUs at, so in that sense, I should have a fairly good idea of the
> speed differences between the different chips.

> Jeff McWilliams

These ratings are unprecise (just estimations)
But, anyway, does it matter ?

68000 8Mhz 0.8 MIPS
68030 16Mhz 5 MIPS

This may be 1 Mips / 4 Mips !

In fact, 68000 is slightly faster than a 286 (and hence
a 386SX) (at same clock speed) and the 68030 is slightly
faster than a 386 (again at same clock speed)

>is awful on a bog-standard IBM/compat', but you're average person buying the
>GEMulator isn't going to want to play heaps of games, so it's not a
>big problem!!)

Now hold on just a minute! You are advising people not to buy an Atari machine because the Gemulator "does everything for a fraction of the cost"? And you are making this claim based on what? The ads you have read? A show demo you have seen? Certainly NOT on first hand knowledge since you say you don't own one!

Sorry, gang, but I can't let this go by. I'm the first to admit that Darek's Gemulator is a really neat hack. It's technologically interesting and that's why I BOUGHT one (I know from whence I speak). But in it's current form it is NOT, I repeat, NOT a realistic replacement for your Atari computer unless your Atari computer needs are _extremely_ simplistic at best.

Again, in the current release version, the Gemulator software is lacking in some very key areas (inability to write to floppies is just one) I find essential before I can throw away my ST's. I have no reason to believe that Darek cannot fix the majority of these shortcomings (Dave Small's MagicSak was pretty limited when it first came out too) in time, but the public _should_ be aware that it is not, in its current state, a _viable_ replacement for your Atari computer, IMHO.

An excellent review of the Gemulator may be found in the most recent issue of Current Notes, BTW. A beta copy of Gemulator was reviewed, but the reviewer's comments still hold true for the current release version.

Let me make it clear that Darek has made _no_ false claims in his ads. Gemulator does indeed do everything (most everything?) it is claimed to do. But keep one foot on the ground, please, and don't read more into his ads than is there, OK?

Darek reads this newsgroup and is more than welcome to reply if he feels I have been unfair. I just don't feel the Gemulator has matured enough to totally replace a "real" ST and did not appreciate Steven's claims that it could. An interesting addition for the PC users? Sure. Replace the ST? Not yet.

Now back to your regularly scheduled flames... :)

Are you talking about STe or Mega STe ?

For the STe, I don't think it is worth to change (unless you
play a lot). For Mega STe, this sounds much better: it is 1.7x
faster, has a separate keyboard, VME bus, SCSI interface etc..

But you also could switch to Falcon :-)

True for NTSC (i.e., Color). But Monochrome in the NTSC
countries is at 60.0 Hz frame rate. Digital audio has no color
information and is recorded at monochrome rates.

>So the sampling rate is:
> 59.94*245*3 = 44.0559 kHz
60.0 *245*3 = 44.1000 kHz

2979. Think Pascal on Spectre

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 15:36:39 UTC
From: weiss@uklira.informatik.uni-kl.de
Message-ID: <1992Sep22.153639.14465@uklirb.informatik.uni-kl.de>
Source record: 217294

Hello,
Think Pascal is alive on Spectre (after some minor patches).
The story:
A few weeks ago a nice guy in this round found a patch to bring
the Think C Debugger to life. (Sorry, I forgot the name of him, shame on me).

I mailed to him, since it could have been the same problems preventing
Think Pascal from work as Think C. Think C, and as I later saw Pascal also,
redirects most exeption handlers into the debugger, in order to track back
all ill-behaviour of the application to debug. Unfortunatly, it catches even
on Mac Pluses (what Spectre believes to be) the exeption vectors for the
arithmetic coprocessor. These are used by Spectre for interrupts of the
keyboard etc.. Additionaly the bus-error-handler was caught, what is deadly
on Spectre.

The patch:
Take a copy of your original Think Pascal 4.0 or 4.0.1. Open it with
ResEdit. Take the CODE 1 resource. Replace at $1CCA the word $FFFF with $0000.
Replace from $1D26 to $1D32 (inclusive) 7 words of $FFFF by $0000.
Close the file. Enjoy.

The disclaimer:
I am not responsible for what you are doing, so take care. The use of
ResEdit is extremly dangerous, if you do not know what you are doing.
Do not use the pached Application on other computers. It worked for me,
and if the moon phase is right, it may work for you.

Comments or hints send to weiss@informatik.uni-kl.de.

Is it possible to build a small TV-window with a cheap
interface, using the DSP, or is it not fast enough to
decode the TV signal? I think I've seen a TV interface
for a big Mac years ago.

2982. TOS upgrade or new computer?????????

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 17:29:29 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1992Sep22.132929.1@sscl.uwo.ca>
Source record: 217288

OKay, first of all thanks to ALL the people who answered my TOS upgrade question :^) Now todays question! Everyone remembers all the stuff about lack of compatibility between OLD ST programs and the STe. Since my choices seem to be a TOS upgrade (and keep my 5+ yr old hardware) or a new STe I want to know if there is a complete list of NON-STe software. I primarily use Word Writer, Hisoft Basic, Timeworks DTP (version 1), and Cyber Studio...anyone know if any of these are NON-Ste? What advice would you nice and experienced netters give on whether to keep the old ST (circa 1985-6) or whether to get the new STe? How long do ST's last anyway...it seems that upgrades/improvements come so rapidly in the computer world that no-one keeps their hardware for long, except out of financial necessity...like me :^(Anyway, any help and/or advice would be appreciated...I've (now) got the money, I want to know what to buy!!!

Excerpts from netnews.comp.sys.atari.st: 22-Sep-92 Re: Falcon030: Higher res. .. Jack W. Wine@uhunix.uhcc (1570)

> Atari said 640x480 with 65K colors exceeded the memory bandwidth
> so the limit must be less than 36 MB/s [640*480*2 bytes*60 hertz = ~36 MB/s]

> 800x600 256 colors use less than 30 MB/s so that might be possible and
> 1024x800 16 colors takes about 24 MB/s so the Falcon might handle
> that too. 1024x800 mono is 6 MB/s so if possible would be great!

> The specs mention that the memory controller operates in page mode so
> that might mean that 32 bits are fetched multiple times and average
> about 240/2 (160 ns cycle + 80 ns thereafter) = ~120 ns for memory
> reads. With a 120 ns average then memory bandwith would be 32 bits
> times 1/120ns = ~32 MB/s. The 68030 would have less time for high
> resolution and color but the application could make the best choice.

> My guesses could be all wrong though. :D

> Jack

640x480 is available in 256 colors non-interlaced or
32K colors interlaced. This means to me that memory
bandwidth is about 640 x 480 x 60hz x 1byte / 0.7 = 26 MB/s
(the 0.7 factor is for scan return, vsync, etc..). Of course
26MB/s is not reallistic. It may be 24MB/s or 32MB/s

Anyway, I consider that less than 60hz non-interlaced is
just not acceptable. So that I don't expect to get much more
than the 640x480 (a bit more with overscan) on the
Falcon, without extension card !

What is a "GEM metafile", how do I use it, and what do I need to
do these things (software)?

Thanks.

2985. FORMATTING DOS DISKS

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 17:43:00 UTC
From: lee.higginbotham@the_matrix.com
Message-ID: <1197.405.uupcb@the_matrix.com>
Source record: 217332

As an aid to those of you who are trying to format disks in DOS,
here is a small excerpt from a DOS 5.0 Ref. manual. Hope this
helps.

FORMAT

Formats a disk for use with MS-DOS.

FORMAT drive: [/V[:label]] [/Q] [/U] [/F:size] [/B | /S]
FORMAT drive: [/V[:label]] [/Q] [/U] [/T:tracks /N:sectors] [/B | /S]
FORMAT drive: [/V[:label]] [/Q] [/U] [/1] [/4] [/B | /S]
FORMAT drive: [/Q] [/U] [/1] [/4] [/8] [/B | /S]

/V[:label] Specifies the volume label.
/Q Performs a quick format.
/U Performs an unconditional format.
/F:size Specifies the size of the floppy disk to format (such
as 160, 180, 320, 360, 720, 1.2, 1.44, 2.88).
/B Allocates space on the formatted disk for system files.
/S Copies system files to the formatted disk.
/T:tracks Specifies the number of tracks per disk side.
/N:sectors Specifies the number of sectors per track.
/1 Formats a single side of a floppy disk.
/4 Formats a 5.25-inch 360K floppy disk in a high-density
drive.
/8 Formats eight sectors per track.

jeff.molofee@outlan.ersys.edmonton.ab.ca (Jeff Molofee) writes:
>What I'm wondering is:
>
>1. Can the Falcon be bought in a Mega Style case?

Not in the first release (the one in October). I would expect a new case design and/or higher-end Falcon by spring of next year, but for now there's only one kind of Falcon ready for release.

>2. Can the Falcon go past 4 megs of Ram.

Yes, you can have up to 14MB of RAM. This is the official statement of Atari -- some people have said that with the internal expansion ports it should be easy to allow the Falcon to access even more memory, as the 68030 is capable of 4GB or some such number. Such an upgrade would probably be a 3rd-party item and wouldn't be necessary anyway unless you're planning to run Unix or something. :)

>3. How are you suppossed to get files onto your HD if there
> is no Floppy Drive or Port?

Umm, you must have missed the part about the Falcon having a 1.44MB internal floppy drive. This should do the trick when it comes to copying things to the hard drive. Also, with the SCSI II port you can hook up external floppies (SCSI ones), 2.88MB drives/floptical drives/tape drives/ hard drives/whatever. There is a wide variety of SCSI peripherals available, so I don't think you'll be left without any storage options (and don't forget you can hook up your SCSI CD-ROM drives too).

>4. Will there or is there a 040 Falcon? and is 16mhz the fastest
> it can run at...

There probably will be a higher-end Falcon, perhaps with an 040 and a different case. In part this depends on the response to the Falcon030 I would imagine. This is a natural progression, and many people have posted about Atari employees telling them a Falcon040 is in the works, but officially there isn't much info about it. We'll have to wait and see.

>
>It sounds like a nice system, but soon there will be SSVGA graphics out
>for IBM, and VGA will be like using CGA on IBM. There will also be 24
>bit sound cards, and faster systems... sigh... what a tough decision.
>

SSVGA? I wonder what that entails. And I can't fathom why anyone would want a 24-bit sound card, isn't 16-bit sampling at 50 KHz sufficient to

completely reproduce the entire range of human hearing? If you mean 24-bit graphics cards, these already exist for IBM and Atari (and other computers) but are very expensive on all platforms. It is a tough decision but I think the Falcon is still the best deal you'll find for the money -- the DSP alone is worth quite a lot, considering the endless possibilities for expansion that it offers, like $100 high-speed modems, direct-to-disk recording, MPEG decoding, raytracing, rendering, etc.

Cheers,

Ben Gilbert

>Yoshi
>

Because we are not all interested in playing games. SOME of us might be musicians, or would like to experiment with the DSP chip for a number of applications, or happen to think that the Falcon is an awful lot of punch for an awful little money. I even read about the Falcon in an Amiga online magazine, and THEY said it was an awful lot of good stuff for a little bit of money. So if you want to play games, buy your Nintendo. This newsgroup is for people who want to make the most out of their Ataris, not just play games. And as for why not get a clone... hahahahahaha!! yeah, right.

>What I'm wondering is:
>
>1. Can the Falcon be bought in a Mega Style case?

Nope. What you see is what you get. The Falcon 030 comes in the old 1040ST style case, albeit with a different colored grey plastic (no longer black). You could always put it in a PC case and use something like DEKA to use a PC keyboard if you feel the absolute need.

>2. Can the Falcon go past 4 megs of Ram.

Yes. Standard configurations are 1Mb, 4Mb and 14Mb. It does not use SIMMS, though.

>3. How are you suppossed to get files onto your HD if there
> is no Floppy Drive or Port?

Wrong. There _is_ a floppy drive built-in, of the 1.44Mb HD variety. The complaint is that there is no _external_ floppy drive port.

>4. Will there or is there a 040 Falcon? and is 16mhz the fastest
> it can run at...

Who knows? There _has_ been developmental work done on an 040 version. My guess is that if the Falcon 030 sales are good, they may likely come out with an 040 version aimed more towards the power user. Separate keyboard, more expandability, performance, etc.

>It sounds like a nice system, but soon there will be SSVGA graphics out
>for IBM, and VGA will be like using CGA on IBM. There will also be 24
>bit sound cards, and faster systems... sigh... what a tough decision.

Oh, it _is_ a nice system, that's for sure, and it's audio capabilities are really unmatched by any other off-the-shelf computer system. Falcon graphics are pretty subjective, but are a lot nicer than what you've seen on stock Atari's before. Whether it's the system for YOU is for you to decide, of course.

I never play on my ST (well sometimes stetris). But I
won't buy a PC just cause I HATE it !!!
What do you think of a nice segmented memory, with a
nice 640K limit ?
ST is not perfect, but it's clean !

Stefan Monnier

PS: by the way: does your *(&*# nintendo have a midi
interface ?
I think the main difference between the Falcon and the
NSF is that the Falcon is a machine with which you can
play whereas the NSF is a machine with which you can
only play !

>announces and buggy software ?

Who are you, and why should we care what you think? You are comparing a games machine to a computer. That is not even a comparison. Nobody will buy a Falcon because it has lots of games. Hell, there aren't any! The damn thing isn't out yet! Perhaps you should wait on your comparisons until you've actually experienced the real thing.

Now that we've cleared that up. Nintendo is for people that have nothing better to do that waste their time playing games. If I (or somebody who might buy a Falcon) was only looking for games, why would I spend more money on something I don't need?

And, getting back to the IBM compatible vs Atari debate. Thats the oldest news in Atari history. You needn't say anything about it. There are other reasons to buy a computer besides the amount of software available. Windows does not come close to matching the ease and user-friendlyness of GEM.

At any rate, this area is not for you people to come in and start bashing Atari. Why are you in here? This area is for people to discuss things concerning the Atari, not whether or not a stupid games machine (note MACHINE, not COMPUTER) is better than a Motorola 68030 that has the capability to do more than all the Nintendos added up in the world together.

You don't buy a computer just for games. If you did, that would be an extraordinary waste of money. You buy it because it can do just about anything you want it to.

I'd like to see a Nintedo SuperFamish*tbox printing a page from Calamus onto a 300 dpi laser printer, or your Superfami-thing compiling a C program or multitasking a BBS and a word processor.

Get the point?

Good. Now go away.

2997. Atari blew it in San Diego

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 23:21:25 UTC
From: coffey@ucselx.sdsu.edu
Message-ID: <1992Sep22.232125.11023@ucselx.sdsu.edu>
Source record: 217301

Atari Corp had an opportunity to show off its products at the San Diego
Computer fair last weekend, and decided to go to Boston in stead.
I don't understand why they couldn't do both.

The San Diego Atari users group had 5 different displays at the fair,
but did not have a single Falcon to show. They expected 10,000 people
to show up, but ended up with 17,000 paid admissions. I can't help
but thinking that Atari Corp could have spared a few Falcons to show
to all those people. I could hear people remark that they thought Atari
was out of the computer business, and that they were surprised to see our
presence. Does anyone know if they plan to stay in this business much
longer?

Cross-posted to: comp.sys.atari.st,misc.forsale.computers

After a bit of consideration, I have decided to part
out one of my computer systems. The following prices are
both fair and firm. Of course, if you wish to purchase the
system as a whole, we can make a deal.

Epson LQ570 360x360 24pin Printer $200
Casio HT-700 Analog Synthesizer (MIDI) $120
Atari 1040ST (4megs RAM, 68000CPU) $200
Atari Megafile 44 (Removable Syquest) $350
Atari SC1224 Color Monitor $100

Both the HD and the Printer have Very Low Miles
Everything else is fully functional.

Let's make a deal.

2999. Help for new Atari owner...

Newsgroup: comp.sys.atari.st
Date: 1992-09-22 23:32:32 UTC
From: weiss@bdcv8
Message-ID: <3693@ra.nrl.navy.mil>
Source record: 217302

Hello there, Netters...

I recently purchased an Atari 520ST from a coworker. Apparently, he had performed some modifications on it in the past and, if I understand it correctly, has the 2-chip set from an Atari 1040ST minus the "blitter" chip Well, what is a "blitter" chip and how can I upgrade from TOS 1.0 to something newer? Also, can I upgrade from 1 Mb RAM to 2 or 4 Mb RAM?

I originally purchased the machine with the intention of acquiring Mac and IBM PC emulators. Are these still available and at a reasonable cost?

Any advice for an Atari convert would be appreciated!!

Thanks

From what i've heard the Falcon 040 is going to be in an IBM style
case. I think! I must remember to capture that message about it and
post it here. Don't take this as fact though....until I post that
message, my memories shocking! :-(.

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <19onofINNj07@golem.wcc.govt.nz>
Source record: 217311

I've just uploaded 'RAWFILES.ZIP' to atari.archive (into the new-directory).
This contains all the .QRT files from st-format disk #35, but they've been
Ray-Traced. These are the 24-bit (over 16-million colour) pictures created
with Quick-Ray-Trace. Which can be viewed/converted to the 'more colours than
than the ST can possible display' with Poly-Chrome.
(Or, can be converted to Spectrum-512 with RAW2SPEC, or Polychrome)

3002. CD-ROMS for Atari Software - Any available?

> Atari has some type of co-op deal where they share the cost of
> advertising with dealers. Have you ever advertised with Atari?
> If not, why? What was the problem? This is the type of stuff that
> we are looking for.

Len, Atari discontinued its Co-Op plan over a year ago. When it was in effect your Atari dealer got a 2% rebate to be used for advertising on purchases he made from Atari Corp. That means if your Atari dealer made $100000.00 worth of purchases from Atari Corp over the course of one year, Atari would rebate $2000.00 for the use of advertising. The dealer got no credit from software purchases, or purchases made from distributers of Atari products. In order to get the credit, the dealer had to make the purchase directly from Atari.

I'm not sure if you know how much advertising you can buy for $2,000.00. If you don't minde I'll give you some idea.

A quarter page add in the Cleveland Plain Dealer is approximately $500.00 so, with $2,000.00, your dealer could purchase 4 quarter page ads in the P.D. (Cleveland Plain Dealer). You could use the money for some radio advertising. I know Bob Conrad (owner of WCLV, a classical FM radio station). Mr. Conrad sells one minute of time at the rate of $80.00 per minute. With $2,000.00 your dealer could buy 24 minutes of air time on WCLV. As you can see, the $2,000.00 doesn't go very far.

The Co-Op plan would have worked very will if Atari would do some meaning-full advertising on its own. Then your dealer could use his Co-Op monies to do supplemental advertising to let the local population know where the local dealer for that product is located.

In any case this topic of conversation doesn't really matter because there is no Co-Op plan.

> Is there a recommended program?
>
> Thanks.

Do you want to create of catalog of the TNY pictures on your disks? or
do you just want to print individual pictures.

If you want to catalog your TNY pictures then I would recommend you
use WizWorks ImageCat. It will catalog (give you a image of the pic
file with the file name under to pic) TNY (All Rez.) IMG, MAC and
several other picture formats.

If you just want to print individual pictures, you could use DEGAS,
TOUCHUP, PAGESTREAM and a host of other programs.

Gemulator comes with TOS 2.06. It also has room on its card for the
2 chip version of at least 3 other versions of TOS. When the program
is loaded you are asked which version of TOS you want to run.

Gemulator needs a 486 running at 33Mhz and 4megs of RAM to operate at
ST 8Mhz speed. If you're using Gemulator on anything less it will
run slower.

At least that's the information that I have.

3009. JOVE for MiNT

>It's an armada compared with those writing Falcon games.

Sure the easy way in life is to buy a cheap 386 based clone, and a Super Famicon - but its not the fun way.

Sure the Super Famicon is a better design for pure arcade games than the falcon [as they say in the arcade world - you dont get anywhere by doing real work - you shirk it with sprites and dual playfields] - but the Falcon has the best sound on *any* affordable computer, and the Falcon will be able to have awesome games - role playing, 3d, arcade, and so forth - sure the IBM pc, and Famicon will always get the pure arcade and role playing games first - but they will be more fun on the falcon :)

BTW Yoshi... if you think I am some atari fanatic then thing again - I have never [yet] had an atari machine - I'm just an amiga/archimedes dood who wants to widen his horizons.

[...]

>These ratings are unprecise (just estimations)
>But, anyway, does it matter ?

>68000 8Mhz 0.8 MIPS
>68030 16Mhz 5 MIPS

This reminds me of the following anecdote which may cast some
light on the significance of MIPS ratings. I was hacking GFA
basic when some guy walked up to me and asked me to hack in an
ultra-simple speed test:

```
t%=TIMER
FOR i&=1 to 10000
l=LOG(i&)
NEXT i&
t%=TIMER-t%
PRINT t%/200;" sec."
```

On the plain old ST where I was hacking, this took about 12.5
sec. in the interpreter and ran slightly faster when compiled.
The guy was very surprised, he told me he did something
equivalent on his private 1 MHz (or even 16MHz? -- I forgot) PC
running under MS-DOS in Turbo Pascal, and although his PC ran at
higher speed, it took longer to execute this test program.

Disclaimer: I shall not be responsible for any ST vs. PC
flames following up this post. This story is meant solely to
illustrate the limits of meaningfulness of MIPS ratings and has
no significance regarding general performance or even "fitness"
of the platforms mentioned.

There's an *extremely* simple terminal program called MTT which works with
MiNT - in fact, it was written with MiNT in mind. It's in German, and the main
purpose is support for the MausNet's batch protocol (MausTausch). But it will
work as a normal terminal program, if you're content to use the TOS VT52
emulator.

Anybody interested ?

Jens.

A 'blitter' is a chip that speeds up all graphics operations (screen redraw
etc.). You don't really need it, although it is nice. A software solution to
speed up all of the graphics is NVDI - a marvelous program, which does lots
more than only speeding up graphics. It *is* commercial, I'm afraid.
re: TOS: there are various boards for sale with newer TOSs. Please upgrade your
machine -TOS 1.0 is a pain. get TOS 1.4 or (better) 2.06.
Maybe someone here knows an address where you can get such an upgrade - or
contact your local Atari dealer (if there is any :).
re: RAM: yes, it's no problem to upgrade to 4 Meg (max.). Same applies: there
are various boards/expansion kits for sale.

>I originally purchased the machine with the intention of acquiring Mac and
>IBM PC emulators. Are these still available and at a reasonable cost?

There are PC-emulators -not too expensive I think- but I know nothing about
them (who wants an IBM on his ST anyway ;-). The only *real good* Mac emulator
is Spectre - combined soft-/hardware (Mac ROMs & -in case you buy the Spectre
GCR) a device that enables you to read Mac disk with the ST floppy drive).
But the Spectre is *not cheap* - although nearly 100% Mac-compatible. Don't know
american prices...

>do these things (software)?
>
>Thanks.

GEM uses two standard formats for the storage of pictures: .IMG and .GEM. The former is a (slightly) compressed bitmap, the latter is the GEM MetaFile you're talking about. It contains a picture described in vectors, making it resolution-independent and scalable without loss of quality. To view them, you need a Meta-driver installed (I think. But It's been a long time since I've done some serious reading on MetaFiles, so I don't dare to state anything more.) Look carefully among your old diskettes, you might have a program called OUTPUT.APP with which you can view MetaFiles.

If you're really interested, drop me a mail and I'll look things up for you.

The Falcon030 is rated a 3.84 MIPS machine (I assume that you mean a Falcon by a 16MHz 68030.) BTW, a 25MHz 68040 is a real MIPSmonster. I can't wait to lay my hands on a Falcon040. And the 68060 is said to do 100MIPS, though this is only a rumour. Anyway, MIPS doesn't only stand for "Million Instructions Per Second", but also for "Meaningless Information about Processor Speed". The Falcon will be faster than the MIPS rating will show, since it has a 16MHz blitter and fast graphics. The graphics are the part which slows a 386SX16 down so much you can't run Windows on it nicely unless you slap out a whopping amount of cash for a fast VGA card.

Source record: 217333

Of course as everybody already knows, the true meaning of the acronym MIPS is Meaningless Indicators of Performance.

Having said that, I wonder if someone can clear up something for me. By 'Instruction' do they mean a machine instruction or a microcode instruction? I would think that the variation in machine instruction execution times would be very large.

Just wondering.

So far so good, but what follows is widely believed and TOTALLY WRONG. I speal from years of direct personal experience exchanging disks between several STs (TOS 1.0 through 1.4...the problems go away completely with 2.06) and many PCs (including PS/2s, laptops and various clones).

> I think this

>is already available can read 10 sector disks, and future
>versions of DOS won't do it unless they either switch to using
>the information in the boot sector or introduce new values for
>the media byte specifying 10 sector formats.
>
All usable DOS versions (in other words, 2.1 and higher) ignore the "media byte" and use the boot sector information for disk reads and writes. It is only necessary to convince DOS that the disk is valid, and it can handle anything TOS can. DOS expects that the first few bytes of the disk's boot sector will be a valid 8086 jump instruction. I always make the first 3 bytes EB 34 90 (generally with MEMFILE). I nearly always use 10-sector twist~red format disks for ST-PC data exchange. I have NEVER, as in NOT EVEN ONCE had a problem with this.

One thing to watch out for, though is that a lot of PC floppy drives are total crap, and break rather quickly. At that point, they won't correctly handle disk exchange with ANY other machine, most irritatingly including commercial software. If you're trying to exchange data between such a machine and an ST on floppy, it will fail for obvious reasons.

From: psurge@cs.utexas.edu
Message-ID: <lc0vtvINNmtr@grit.cs.utexas.edu>
Source record: 217342

I also have a story about MIPS. My professor tells of testing the MIPS of his machine with a certain C compiler. The code used a large loop and generated the sum a + b, which was never printed out or used anywhere. The program would run in under 5 seconds, which produced an average MIPS rating for the machine. A few months later they received a new compiler and tried the code with the new compiler. This time the program ran in less than 1 second, producing an an astronomical MIPS rating. When they examined the code, they found the compiler's optmizer checked the loop, discovered the a + b computation was never used, and completely eliminated the loop altogether.

The whole point is that optimized code does not produce the MIPS results one might expect. What runs blindingly fast on a slow machine, may execute slower on a fast machine. Also be aware that some compilers recognize MIPS benchmarks and know how to fudge the results.

In short, just as others have said, MIPS really stands for "Meaningless Information about Processor Speed".

I tried to email to you but my bitnet connectivity is kinda flaky:-).

I'm seeking something similar - binaries for the K5 librarian for
glib. I've posted twice and gotten no response. If anyone emails to
Andrea, please also send info to me (I need to either find binaries,
fight glib for building on a dual floppy system, or just hack out a
little program to download K5 banks using the glib file format (not a
big deal, but saving time is what all this is about:-)).

Thanks and have fun! - Bob

I've been using Erling Henanger's (erlingh@idt.unit.no) port for a couple of months, and it works perfectly!

You can find the diffs at a.a in the new-directory as atari-groff.zoo.
The archive also includes a simple man-shellscript.

>the function XBIOS(4) yields the following results:
> 0 for low rez
> 1 for mid rez
> 2 for hi rew

That's correct, but it's not a VDI method. To get the resolution
of a virtual workstation, you need to look at the work_out array.
In GFA that's as easy as it could be:

WORK_OUT(0) is the max. visible x coordinate
WORK_OUT(1) is the max. visible y coordinate

Besides using the VDI, this method is easier IMHO, since you
can spare the table mapping the values returned by the XBIOS(4,
...) function to the actual resolutions.

BTW, there's other useful stuff to be found in the work_out
array, such as WORK_OUT(3) and WORK_OUT(4), which give the width
and height of a pixel, and WORK_OUT(13), which give the number of
colors.

Hi folks,

I've recently started installing PamsNet (an ethernet-based Atari
network), along with the PamsNet server for VMS on our VAX.
Although (and because) the installation is not yet finished
successfully, I'd like to get in contact with others who can
share experiences, hints, questions etc. about PamsNet.

Thanks for any replies,

Jan

I'm looking to get a sound digitizer to use with my ST. I was wondering which one I should buy, or if there is even a choice these days? I'm looking to be able to play sounds into the ST via a tape recorder, or directly through a microphone. Are there any digitizers still being made? Which is the best quality? Which one will allow me most easily to transfer my sounds between the ST and Mac world?
I'd appreciate any advice anyone has on this topic.

Concerning the Atari Falcon memory speed, does anyone know the ns speed of chips needed. I already understand that Atari will sell memory boards in 1, 4, 14 meg configuration, however, it is usually MUCH cheaper to buy memory in simm modules and hack them in to the machine, as it what I did on my 1040ST.
Thanks,
Jonathan

>Paul Meekin (PMEEKIN@ESOC.BITNET)
>ESA Operations Centre
>Darmstadt

Nowadays, when people talk about MIPS, they are usually talking about Dhyrstone MIPS. This is defined as the number of Dhrystones/sec executed by a machine divided by 1753, which is the number of Dhrystones/sec executed by a Vax 11/750. In general, a 25 MHz 68030 seems to do 6000-8000 Dhrystones depending on the machine and the compiler, which would translate into 4-5 MIPS. So, assuming everything else is equal (usually not a good assumption, but ...), a 16 MHz 68030 should get about 4000-5400 Dhrystones, or 3-4 MIPS.

> 1 for mid rez
> 2 for hi rew

And what about TT rez, graphics cards, overscan, ...
If you want your prg to run on your machine and only on it, go ahead, use Xbios. But if you wish your prg could run on Falcon, different graphics modes, atari emulators, etc... (and if you want you r prg to be 'clean'), just forget about it !

Avoid Xbios as much as possible, cause it IS machine dependent ! (it is of course not always possible)

>3. How are you suppossed to get files onto your HD if there
> is no Floppy Drive or Port?
>4. Will there or is there a 040 Falcon? and is 16mhz the fastest
> it can run at...
>

1. Nope, not so far. Although I believe there have been a LOT of requests for it, so maybe Atari will think it over.
2. Yes, it has a limit of 14 megs RAM I believe.
3. There is an internal floppy drive, but no port for an external. They figured you don't really need it. And as far as I'm concerned, if you have a hard drive, you really only need one floppy anyway.
4. If there is ever an 040 Falcon (or any 040 Atari at all), it will be in the future and Atari will let everyone know. So far, the limit is at 16 MHz, but of course, I am sure it would be POSSIBLE to replace the motherboard with a faster version. However, that doesn't bring it up to full speed, because the rest of the computer would still be running at 16 MHz.

Thanks Mr. Carter. I am really used to comments like that as the same language is used against me in the official Atari conference called "Atari Explorer Online." Mind you, Mr. Brodie who is the official Atari director of communication, wasn't doing anything to stop it since he enjoys people putting down Atari users who do not agree with him and Atari Corporation's position.

I would invite any user to join the ST 16/32 Bit conference and see what is actually going on. This week I have been accused by an OFFICIAL Atari dealer of being a lier and he called me publically an "ASSHOLE." Mind you, this person was employeed by Atari Corporation and he is the official service center for Atari Canada. Furthermore, he used an alias to post the offensive AND he used profanities wherever possible. He used the alias "Chucky" and "Chuck Mariotty" even though his real name is Sonny Ang and he is the owner of a store called "Compuworld." I will be more than happy to repost the messages from him so people realise what kind of people Atari hires.

Sincerely,
Mark K.

PPM stands for Portable PixMap and is used mostly on Unix systems I believe (if you look on many Unix systems, and especially those with XWindows, you'll find that there are utilities to convert MANY different kinds of graphics files, such as pbm, ptx, ppm, pnm, gif, img, xbm, jpg, etc -- usually the utility will be called ppmtogif or something like that).

Oh, also from the man page it says that PPM is "a lowest common denominator color image file format."

Hope that satisfies your curiousity... :-)

I am currently an officer of new Atari User Group - We wish to obtain official status as a User Group and register with Atari Corp. Over the past few years, the people at Atari involved with registering user groups have come and gone, so I do not know who the people that currently do this are, nor do I know how I would contact such person(s). Someone told me I should go through Bob Brodie, but I do not know how to reach him, either. Any and all input on how to become a registered user group would be GREATLY (read, PLEASE HELP ME!) appreciated.....<G>

> [IMG] is a (slightly) compressed bitmap

Actually, IMG is a very good format for what it was designed for: high-speed compression/decompression of black-and-white images (ie. not dithered).

Loading IMG's from a hard-disk is faster than loading the raw image should (well, it depends on the application's routines, of course, but simple C routines suffice).

3066. Motorola press release of Atari Falcon030

Newsgroup: comp.sys.atari.st
Date: 1992-09-24 01:46:19 UTC

MOTOROLA'S 56001 PROVIDES AUDIO/VIDEO FEATURES FOR
ATARI'S FALCON030 PERSONAL INTEGRATED MEDIA COMPUTER

BOSTON, Mass., September 23, 1992 - Motorola Inc.'s Microprocessor and Memory Technologies Group today announced that its 56001 digital signal processor (DSP) performs key audio/video functions on the motherboard of the new Atari Falcon030(tm) personal-integrated, media computer. The Falcon030 is a full-scale computer that uses the 32 MHz 56001 to process and manipulate compact-disc-quality digital audio and voice signals which, combined with Atari's integrated software, makes the Falcon030 a complete, personal integrated media computer.

"Motorola's 24-bit DSPs continue to be the choice for manufacturers that want to embed compact-disc, digital audio functions," said Bryant Wilder, Motorola's DSP operations manager. "The 56001 gives Atari's Falcon030 an impressive feature set that is showing the rest of the industry where personal computers are heading."

DSPs are capable of performing functions such as compact disc quality sound, voicemail, voice annotation and recognition, video compression, facsimile transmission, high-speed modem, array processing and high-speed numeric processing. Other major computer manufacturers that use the DSP56000 family on their motherboard include the NeXT Computer System and Silicon Graphics IRIS Indigo(tm) RISC PC.

Atari's Falcon030 Personal Integrated Media Computer

Atari's Falcon030 is designed for personal-integrated media functions including video, audio, animation, telecommunications and graphics. The Atari Falcon030 uses the 56001 DSP to process compact-disc quality audio and voice synthesis capabilities. The 56001 operates independent of the central processor, Motorola's 68030, and completes a variety of tasks without slowing the system. Within the Atari Falcon030, Motorola's 56001 drives digital audio functions including graphic equalization, channel manipulation, reverberation and surround sound, all which provide the user professional audio effects for tasks such as video sound augmenting and recording capabilities.

"Atari's Falcon030, with the help of Motorola's 56001 DSP, is bringing professional-level recording and audio manipulation capabilities to the consumer," said Sam Tramiel, Atari's president and CEO. "Motorola's 56001 provides a single chip solution for

digital audio and voice capabilities optimizing the Falcon030 as a personal-integrated media computer."

Motorola's DSP56001

Motorola's 24-bit, 32 MHz 56001 processes 16 million instructions per second (MIPS) and performs 96 million operations per second (MOPS). The 56001 recreates CD-quality sound because its architecture is highly parallel and its 24-bit word width generates sound up to 144 decibels of dynamic range. The 56001 differs from other DSPs in that it processes signals in 24-bit data chunks providing throughput of more than 100 million operations per second.

Motorola's 24-bit 56000 architecture is important since most analog-to-digital converter chips, which convert analog signals into digital bit streams, translate analog signals in the ranges of 14 to 20 bits at a time. The extra bits in the 56000 architecture allow additional calculations to be performed on these digital samples while maintaining the input signal accuracy.

Atari Corporation (AMEX:ATC) is a worldwide manufacturer and marketer of palmtop through desktop computer systems. The company sells its systems, peripherals and software through authorized distributors, resellers and integrators.
